        (Sensor mousePoint)
        using: bunny)
  duration: camera rightNow ]
```

S.Ducasse

3

Outline

Literals: numbers, strings, arrays....

Variable, assignments, returns

Pseudo-variables

Message Expressions

Block expressions

Conditional and Loops

S.Ducasse

2

Numbers

- SmallInteger, Integer
 - 4, 2r100 (4 in base 2), 3r11 (4 in base 3), 1232
- Automatic coercion
 - 1 + 2.3 -> 3.3
 - 1 class -> SmallInteger
 - 1 class maxVal class -> SmallInteger
 - (1 class maxVal + 1) class -> LargeInteger
- Fraction, Float, Double
 - 3/4, 2.4e7, 0.75d
 - (1/3) + (2/3) -> 1
 - 1000 factorial / 999 factorial -> 1000
 - 2/3 + 1 -> (5/3)

S.Ducasse

4

Characters

- Characters:
 - \$F, \$Q \$U \$E \$N \$T \$i \$N
- Unprintable characters:
 - Character space, Character tab, Character cr

S.Ducasse

5

Strings

- Strings:
 - #mac asString -> 'mac'
 - 12 printString -> '12'
 - 'This packet travelled around to the printer' l"idiot'
 - String with: \$A
 - Collection of characters
 - 'lulu' at: 1 -> \$1
- To introduce a single quote inside a string, just double it.

S.Ducasse

6

Symbols

- Symbols:
 - #class #mac #at:put: ## #accept:
- Kinds of String
- Unique in the system (see after)

S.Ducasse

7

Symbols vs. Strings

- Symbols are used as method selectors, unique keys for dictionaries
- A symbol is a read-only object, strings are mutable objects
- A symbol is unique, strings are not
 - #calvin == #calvin Prlt-> true
 - 'calvin' == 'calvin' Prlt-> false
 - #calvin, #zeBest Prlt-> 'calvinzeBest'
- Symbols are good candidates for identity based dictionaries (IdentityDictionary)
- Hint: Comparing strings is slower than comparing symbols by a factor of 5 to 10. However, converting a string to a symbol is more than 100 times more expensive.

S.Ducasse

8

Comments and Tips

- "This is a comment"
- A comment can span several lines. Moreover, avoid putting a space between the “ and the first character. When there is no space, the system helps you to select a commented expression. You just go after the “ character and double click on it: the entire commented expression is selected. After that you can printIt or dolt, etc.

S.Ducasse

9

Arrays

- ```
#(1 2 3) #'(lulu' (1 2 3))
-> #'(lulu' #(1 2 3))
```
- #(#(mac node1 pc node2 node3 lpr)
    - an array of symbols.
  - When one prints it it shows  
`#(#mac #node1 #pc #node2 #node3 #lpr)`
  - in VW Byte Array `#[1 2 255]`

S.Ducasse

10

## Arrays

- Heterogenous  
`#('lulu' (1 2 3))`  
`Prlt-> #'(lulu' #(1 2 3))`  
`#('lulu' 1.22 1)`  
`Prlt-> #'(lulu' 1.22 1)`
- An array of symbols:
  - #(#(calvin hobbes suzie))
  - `Prlt-> #(#calvin #hobbes #suzie)`
- An array of strings:
  - #(#('calvin' 'hobbes' 'suzie'))
  - `Prlt-> #(#('calvin' 'hobbes' 'suzie'))`

S.Ducasse

11

## Syntax Summary

|             |                                                 |
|-------------|-------------------------------------------------|
| comment:    | “a comment”                                     |
| character:  | \$c \$h \$a \$r \$a \$c \$t \$e \$r \$s \$# \$@ |
| string:     | ‘a nice string’ ‘lulu’ ‘I’idiot’                |
| symbol:     | #mac #+                                         |
| array:      | #(1 2 3 (1 3) \$a 4)                            |
| byte array: | #[1 2 3]                                        |
| integer:    | 1,2r101                                         |
| real:       | 1.5, 6.03e-34, 4, 2.4e7                         |
| float:      | 1/33                                            |
| boolean:    | true, false                                     |
| point:      | 10@120                                          |

Note that @ is not an element of the syntax, but just a message sent to a number. This is the same for /, bitShift, ifTrue:, do: ...

S.Ducasse

12

## Roadmap

Literals: numbers, strings, arrays....

### Variable, assignments, returns

Pseudo-variables

Message Expressions

Block expressions

Conditional and Loops

S.Ducasse

i3

## Temporary Variables

- To hold temporary values during evaluation (method execution or sequence of instructions)
- Can be accessed by the expressions composing the method body.
  - | mac1 pc node1 printer mac2 packet |

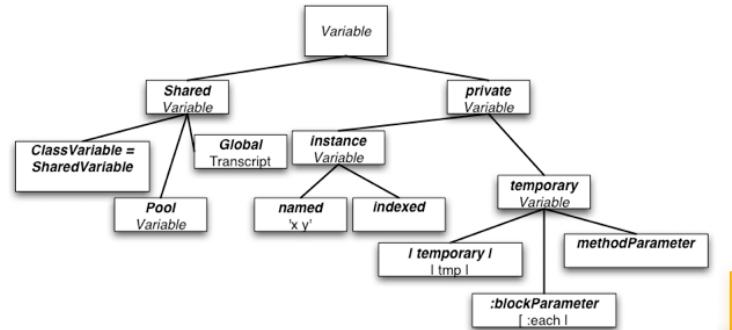

S.Ducasse

i5

## Variables

- Maintains a reference to an object
- Dynamically typed and can reference different types of objects
- Shared (starting with uppercase) or local/private (starting with lowercase)

S.Ducasse

i4

## Temporary Variable Good Style

- Avoid using the same name for a temporary variable and a method argument, an instance variable or another temporary variable or block temporary. Your code will be more portable.

Do not write:

```
aClass>>printOn: aStream
|aStream|
...
```

- Instead, write:

```
aClass>>printOn: aStream
|anotherStream|
...
```

- Hint: Avoid using the same temporary variable for referencing two different objects

S.Ducasse

i6

## Assignments

- An assignment is not done by message passing. It is one of the few syntactic elements of Smalltalk.

```
variable := aValue
three := 3 raisedTo: 1
```

S.Ducasse

17

- Avoid using var := var2 := var3
- To not try to know in which order the expressions is evaluated. You will write good code

## Pointing to the Same Object

- In Smalltalk, objects are manipulated via implicit pointers: everything is a pointer.
- Take care when different variables point to the same object:  
`p1 := 0@100.  
p2 := p1.  
p1 x: 100`

```
p1
-> 100@100
p2
-> 100@100
```

S.Ducasse

18

## Method Arguments

- Can be accessed by the expressions composing the method.
- Exist during the execution of the defining method.
- Method Name Example:  
`accept: aPacket`
- In C++ or Java:  
`void Printer::accept(aPacket Packet)`

S.Ducasse

19

## Arguments are read-only

- Method arguments cannot change their value within the method body.
- Invalid Example, assuming contents is an instance variable:

```
MyClass>>contents: aString
aString := aString, 'From Lpr'.
```

- Valid Example

```
MyClass>>contents: aString
| addressee |
addressee := aString , 'From Lpr'
```

S.Ducasse

20

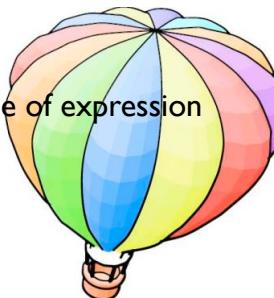

## Method Return

Use ^ expression to return the value of expression from a method

Rectangle>>area

`^ width * height`

By default self is returned

S.Ducasse

21

## Instance Variables

- Private to a particular instance (not to all the instances of a class like in C++).
- Can be accessed by all the methods of the defining class and its subclasses.
- Has the same lifetime as the object.
- Declaration

Object subclass: #Node  
instanceVariableNames: 'name nextNode'  
...

S.Ducasse

22

## Instance Variables

- Scope: all the methods of the class

```
Node>>setName: aSymbol nextNode: aNode
 name := aSymbol.
 nextNode := aNode
```

- But preferably accessed using accessor methods

```
Node>>name
 ^name
```

S.Ducasse

23

## Global Variables

- Always Capitalized (convention)
  - `MyGlobalPi := 3.1415`
- If it is unknown, Smalltalk will ask you if you want to create a new global
  - Smalltalk at: #MyGlobalPi put: 3.14
  - `MyGlobalPi` Prlt-> 3.14
  - Smalltalk at: #MyGlobalPi Prlt-> 3.14
- Stored in the default environment: Smalltalk in Squeak, VW has namespaces
- Design Hints: Accessible from everywhere, but it is not a good idea to use them

S.Ducasse

24

## Roadmap

Literals: numbers, strings, arrays....

Variable, assignments, returns

### Pseudo-variables

Message Expressions

Block expressions

Conditional and Loops

S.Ducasse

25

## Six Pseudo-Variables

- **true**
  - unique instance of the class True
- **false**
  - unique instance of the class False
- Hint: Don't use False instead of false. false is the boolean value, False the class representing it. So, the first produces an error, the second not:
- False ifFalse: [Transcript show: 'False'] -> error
- false ifFalse: [Transcript show: 'False']

S.Ducasse

27

## Six Pseudo-Variables

- Smalltalk expressions can contain true, false, nil, self, super, thisContext, but cannot change their values. They are hardwired into the compiler.
- nil nothing, the value for the uninitialized variables. Unique instance of the class UndefinedObject

S.Ducasse

26

## self, super, and thisContext

- Only make sense in a method body
- **self** refers to the receiver of a message.
- **super**
  - refers also to the receiver of the message but its semantics affects the lookup of the method. It starts the lookup in the superclass of the class of the method containing the super.
- **thisContext**
  - refers to the instance of MethodContext that represents the context of a method (receiver, sender, method, pc, stack). Specific to VisualWorks and to Squeak

S.Ducasse

28

## self and super examples

PrinterServer>>accept: thePacket  
"If the packet is addressed to me, print it.  
Otherwise behave normally."

```
(thePacket isAddressedTo: self)
ifTrue: [self print: thePacket]
ifFalse: [super accept: thePacket]
```

S.Ducasse

29

## thisContext Example: #haltIf:

- How supporting halt in methods that are called often (e.g., OrderedCollection>>add:)
- Idea: only halt if called from a method with a certain name

```
Object>>haltIf: aSelector
| ctxt |
ctxt := thisContext.
[ctxt sender isNil] whileFalse: [
 ctxt := ctxt sender.
 (ctxt selector = aSelector) ifTrue: [
 Halt signal
].
```

S.Ducasse

30

## Roadmap

Literals: numbers, strings, arrays....

Variable names

Pseudo-variables

Assignments, returns

### Message Expressions

Block expressions

Conditional and Loops

S.Ducasse

31

## Objects and Messages

- Objects communicate by sending message
- Objects react to messages by executing methods

Bot new go: 30 + 50

- A message is composed of:
  - a receiver, always evaluated (Bot new)
  - a selector, never evaluated #go:
  - and a list possibly empty of arguments that are all evaluated (30 + 50)
- The receiver is linked with self in a method body.

S.Ducasse

32

## Three Kinds of Messages

- Unary Messages
  - 2.4 inspect  
macNode name
- Binary Messages
  - $I + 2 \rightarrow 3$
  - $(I + 2) * (2 + 3) Prlt \rightarrow 15$
  - $3 * 5 Prlt \rightarrow 15$
- Keyword Messages
  - $6 gcd: 24 Prlt \rightarrow 6$
  - pcNode nextNode: node2
  - Turtle new go: 30 color: Color blue

S.Ducasse

33

## Unary Messages

### aReceiver aSelector

|                |                                             |
|----------------|---------------------------------------------|
| node3 nextNode | $\rightarrow$ printerNode                   |
| node3 name     | $\rightarrow$ #node3                        |
| I class        | $\rightarrow$ SmallInteger                  |
| false not      | $\rightarrow$ true                          |
| Date today     | $\rightarrow$ Date today September 19, 1997 |
| Time now       | $\rightarrow$ 1:22:20 pm                    |
| Float pi       | $\rightarrow$ 3.1415926535898d              |

S.Ducasse

34

## Binary Messages

### aReceiver aSelector anArgument

- Used for arithmetic, comparison and logical operations
- One or two characters taken from:
  - + - / \ \* ~ < > = @ % | & ! ?,
    - $I + 2$
    - $2 >= 3$
    - $100 @ 100$
    - 'the', 'best'
- Restriction:
  - second character is never \$-

S.Ducasse

35

## Simplicity has a Price

- no mathematical precedence so take care

$$\begin{aligned}3 + 2 * 10 &\rightarrow 50 \\3 + (2 * 10) &\rightarrow 23 \\(1/3) + (2/3) \text{ and not} \\1/3 + 2/3\end{aligned}$$

S.Ducasse

36

## Keyword Messages

**receiver**

**keyword1: argument1**

**keyword2: argument2**

I between: 0 and: 5

dict at: #blob put: 8+3

- In C-like languages it would be:

receiver.keyword1 keyword2(argument1, argument2)

S.Ducasse

37

## Keyword Messages

Workstation **withName: #Mac2**

mac **nextNode: node1**

Packet

**send: 'This packet travelled around to'**

**to: #lw100**

**I@I setX: 3**

**#(1 2 3) at: 2 put: 25**

**I to: 10 -> (I to: 10) anInterval**

Browser **newOnClass: Point**

Interval **from: I to: 20 Prlt-> (I to: 20)**

**I2 between: 10 and: 20 Prlt-> true**

**x > 0 ifTrue:[ 'positive' ] ifFalse:[ 'negative' ]**

S.Ducasse

38

## Composition Rules

- **Unary-Msg > Binary-Msg > Keywords-Msg**
- at same level, from the left to the right

2 + 3 squared -> 11

2 raisedTo: 3 + 2 -> 32

#(1 2 3) at: I+I put: 10 + 2 \* 3 -> #(1 36 3)

2 raisedTo: 3 + 2 <=> (2 raisedTo: (3+2)) -> 32

S.Ducasse

39

## Composition Rules

- **(Msg) > Unary-Msg > Binary-Msg > Keywords-Msg**

69 class inspect

(0@0 extent: 100@100) bottomRight

S.Ducasse

40

## Hints ...

- Use () when two keyword-based messages occur within a single expression, otherwise the precedence order is fine.

x isNil ifTrue: [...]

- **isNil** is an unary message, so it is evaluated prior to **ifTrue:**

x includes: 3 ifTrue: [...]

- is read as the message *includes:ifTrue:*  
(x includes: 3) ifTrue: [...]
- We use () to disambiguate them

S.Ducasse

41

## Sequence

message1 .

message2 .

message3

. is a separator, not a terminator

| macNode pcNode node1 printerNode |

macNode := Workstation withName: #mac.

Transcript cr.

Transcript show: 1 printString.

Transcript cr.

Transcript show: 2 printString

S.Ducasse

42

## For the Lazy: the Cascade

receiver

selector1;  
selector2; ...

- To send multiple messages to the same object

Transcript show: 1 printString.  
Transcript cr

- is equivalent to:

Transcript show: 1 printString ; cr

S.Ducasse

43

## Syntax Summary

assignment: var := aValue

unary message:

binary message:

keyword based:

arg2...

cascade:

separator:

result:

parenthesis:

receiver selector

receiver selector argument

receiver keyword1:arg1 keyword2:

message ; selector ...

message . message

^

(...)

S.Ducasse

44

## Roadmap

Literals: numbers, strings, arrays....

Variable, assignments, returns

Pseudo-variables

Message Expressions

### Block expressions

Conditional and Loops

S.Ducasse

45

## Blocks

- **anonymous methods**

- **deferred block of code**

fct(x) =  $x^2 + x$

fct(2) = 6

fct(20) = 420

|fct|

fct := [:x | x \* x + x].

fct value: 2 Prlt-> 6

fct value: 20 Prlt-> 420

fct Prlt-> aBlockClosure

46

S.Ducasse

## Blocks Continued

```
[:variable1 :variable2 |
 | blockTemporary1 blockTemporary2 |
 expression1.
 ...variable1 ...]
```

- Two blocks without arguments and temporary variables

```
PrinterServer>>accept: thePacket
(thePacket isAddressedTo: self)
 ifTrue: [self print: thePacket]
 ifFalse: [super accept: thePacket]
```

S.Ducasse

47

## Block Evaluation

[....] value

or value: (for one arg)

or value:value: (for two args)

or value:value:value: ...

or valueWithArguments: anArray

[2 + 3 + 4 + 5] value

[:x | x + 3 + 4 + 5] value: 2

[:x :y | x + y + 4 + 5] value: 2 value: 3

[:x :y :z | x + y + z + 5] value: 2 value: 3 value: 4

[:x :y :z :w | x + y + z + w] value: 2 value: 3 value: 4 value: 5

S.Ducasse

48

## Block

- The value of a block is the value of its last statement, except if there is an explicit return ^
- Blocks are first class objects.
- They are created, passed as argument, stored into variables...

S.Ducasse

49

## Blocks - Continued

```
|index bloc |
index := 0.
bloc := [index := index + 1].
index := 3.
bloc value -> 4
```

Integer>>factorial

"Answer the factorial of the receiver. Fail if the receiver is less than 0."  
| tmp |  
....  
tmp := 1.  
**2 to: self do: [:i | tmp := tmp \* i].**  
^tmp

S.Ducasse

50

Literals: numbers, strings, arrays....  
Variable, assignments, returns  
Pseudo-variables  
Message Expressions  
Block expressions  
**Conditional and Loops**

S.Ducasse

51

## Yes ifTrue: is sent to a boolean

Weather isRaining  
**ifTrue:** [self takeMyUmbrella]  
**ifFalse:** [self takeMySunglasses]

ifTrue:ifFalse is sent to an object: a boolean!

S.Ducasse

52

## Conditional: messages to booleans

- aBoolean **ifTrue:** aTrueBlock **ifFalse:** aFalseBlock
- aBoolean **ifFalse:** aFalseBlock **ifTrue:** aTrueBlock
- aBoolean **ifTrue:** aTrueBlock
- aBoolean **ifFalse:** aFalseBlock

(thePacket isAddressedTo: self)

```
ifTrue: [self print: thePacket]
ifFalse: [super accept: thePacket]
```

- Hint: Take care — true is the boolean value and True is the class of true, its unique instance!

S.Ducasse

53

## Yes a collection is iterating on itself

```
#(1 2 -4 -86)
do: [:each | Transcript show: each abs
printString ;cr]
```

```
> 1
> 2
> 4
> 86
```

**Yes we ask the collection object to**

S.Ducasse

55

## Boolean Messages

- Logical Comparisons: &, |, xor:, not  
**aBooleanExpr** comparison **aBooleanExpr**
  - (l isZero) & false
  - Date today isRaining not
- Uniform, but optimized and inlined (macro expansion at compile time)
- aBooleanExpression **and:** orBlock  
orBlock will **only** be evaluated if aBooleanExpression is true  
false and: [| error: 'crazy'  
Print -> false and not an error

S.Ducasse

54

## Some Basic Loops

- aBlockTest whileTrue
- aBlockTest whileFalse
- aBlockTest whileTrue: aBlockBody
- aBlockTest whileFalse: aBlockBody
- anInteger timesRepeat: aBlockBody
- [x < y] whileTrue: [x := x + 3]
- 10 timesRepeat: [ Transcript show: 'hello'; cr]

S.Ducasse

56

## For the Curious... (VW)

```
BlockClosure>>whileTrue: aBlock
 ^ self value
 ifTrue:[aBlock value.
 self whileTrue: aBlock]
```

```
BlockClosure>>whileTrue
 ^ [self value] whileTrue:[]
```

S.Ducasse

57

## For the Curious...

```
Integer>>timesRepeat: aBlock
 "Evaluate the argument, aBlock, the number
 of
 times represented by the receiver."
```

```
| count |
count := 1.
[count <= self] whileTrue:
 [aBlock value.
 count := count + 1]
```

S.Ducasse

58

## Choose your Camp!

To get all the absolute values of numbers you could write:

```
|result|
aCol := #(2 -3 4 -35 4 -11).
result := aCol species new: aCol size.
1 to: aCollection size do:
 [:each | result
 at: each put: (aCol at: each) abs].
result
```

S.Ducasse

59

## Choose your Camp!!

- You could also write:  
`#( 2 -3 4 -35 4 -11) collect: [ :each | each abs ]`

- Really important: Contrary to the first solution, the second solution works well for indexable collections and also for sets.

S.Ducasse

60

## Iteration Abstraction: do:/collect:

**aCollection do: aOneParameterBlock**  
**aCollection collect: aOneParameterBlock**  
**aCollection with: anotherCollection do: aBinaryBlock**

```
#(15 10 19 68) do:
 [:i | Transcript show: i printString ; cr]

#(15 10 19 68) collect: [:i | i odd]
 Prlt-> (true false true false)

#(1 2 3) with: #(10 20 30)
 do: [:x :y| Transcript show: (y ** x) printString ; cr]
```

S.Ducasse

61

## Opening the Box

Iterators are messages sent to collection objects  
Collection is responsible of its traversal

**SequenceableCollection>>do: aBlock**  
"Evaluate aBlock with each of the receiver's elements  
as the argument."

I to: self size do: [:i | aBlock value: (self at: i)]

S.Ducasse

62

## select:/reject:/detect:

**aCollection select: aPredicateBlock**  
**aCollection reject: aPredicateBlock**  
**aCollection detect: aOneParameterPredicateBlock**  
**aCollection**  
 **detect: aOneParameterPredicateBlock**  
 **ifNone: aNoneBlock**

```
#(15 10 19 68) select: [:i|i odd] -> (15 19)
 #(15 10 19 68) reject: [:i|i odd] -> (10 68)
 #(12 10 19 68 21) detect: [:i|i odd] Prlt-> 19
 #(12 10 12 68) detect: [:i|i odd] ifNone:[I] Prlt-> I
```

S.Ducasse

63

## inject:into:

**aCollection inject: aStartValue into: aBinaryBlock**

```
| acc |
acc := 0.
#(1 2 3 4 5) do: [:element | acc := acc + element].
acc
-> 15
```

Is equivalent to

```
#(1 2 3 4 5)
inject: 0
into: [:acc :element| acc + element]
-> 15
```

Do not use it if the resulting code is not crystal clear!

S.Ducasse

64

## Other Collection Methods

- aCollection includes: anElement**
- aCollection size**
- aCollection isEmpty**
- aCollection contains: aBooleanBlock**

```
#(1 2 3 4 5) includes: 4 -> true
 #(1 2 3 4 5) size -> 5
 #(1 2 3 4 5) isEmpty -> false
 #(1 2 3 4 5) contains: [:each | each isOdd] -> true
```

S.Ducasse

65

## [] when you don't know times

```
(x isZero) ifTrue: [...]
```

```
[x<y] whileTrue: [x := x + 3]
```

S.Ducasse

66

## What we saw

- Numbers (integer, real, float...), Character \$a, String 'abc', Symbols (unique Strings) #jkk,
- Arrays (potentially not homogenous) #(a #(1 2 3)), Array with: 2+3
- Variables:
  - Lowercase => private
  - Instance variables (visible in by all methods), method arguments (read-only), local variable |a|
  - Uppercase => global
- Pseudo Var: true, false, nil, self, super
  - self = \*\*always\*\* represents the msg receiver
  - nil = undefined value

S.Ducasse

67

## What we saw

- Three kinds of messages
  - Unary: Node new
  - Binary: 1 + 2, 3@4
  - Keywords: aTomagoshi eat: #cooky furiously: true
- (Msg) > unary > binary > keywords
- Same Level from left to right
- Block
  - Functions

```
fct(x)= x*x+3, fct(2).
```

```
fct :=[:x| x * x + 3]. fct value: 2
```
  - Anonymous method
  - Passed as method argument:

```
factorial
```

```
tmp:= 1.
```

```
2 to: self do: [:i| tmp := tmp * i]
```
