What and Why ?

Definition

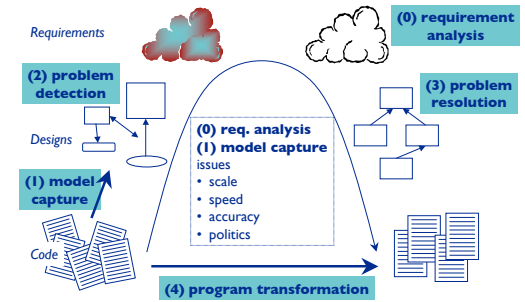

Reverse Engineering is the *process of analysing* a subject system
 + to identify the system's components and their interrelationships and
 + create representations of the system in another form or at a higher level of abstraction. — Chikofsky & Cross, '90

Motivation

Understanding other people's code
 (cf. newcomers in the team, code reviewing, original developers left, ...)

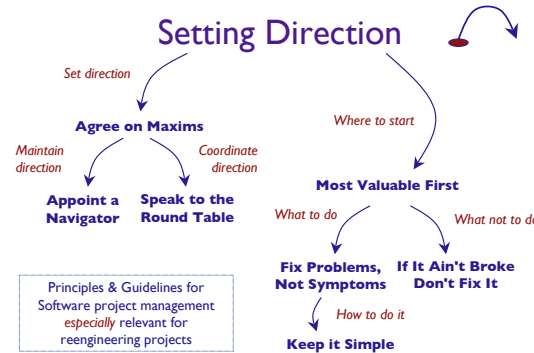

Generating UML diagrams is NOT reverse engineering
 ... but it is a valuable support tool

The Reengineering Life-Cycle

Forces — Setting Direction

- **Conflicting interests** (technical, ergonomic, economic, political)
- Presence/absence *original developers*
- **Legacy architecture**
- **Which problems** to tackle?
 - + Interesting vs important problems?
 - + Wrap, refactor or rewrite?

Most Valuable First

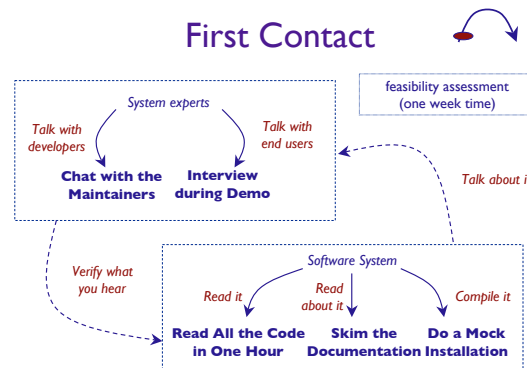

Problem: Which problems should you focus on first?
Solution: Work on aspects that are most valuable to your customer

- Maximize commitment, early results; build confidence
- Difficulties and hints:
 - + Which *stakeholder* do you listen to?
 - + What *measurable goal* to aim for?
 - + Consult *change logs* for high activity
 - + Play the *Planning Game*
 - + Wrap, refactor or rewrite? — *Fix Problems, not Symptoms*

Forces — First Contact

- **Legacy systems** are large and complex
 - + Split the system into manageable pieces
- **Time is scarce**
 - + Apply *lightweight techniques* to assess feasibility and risks
- **First impressions** are dangerous
 - + Always *double-check your sources*
- **People have different agendas**
 - + *Build confidence; be wary of skeptics*

First Contact

Chat with the Maintainers

Problem: What are the history and politics of the legacy system?

Solution: Discuss the problems with the system maintainers.

- Documentation will mislead you (various reasons)
- Stakeholders will mislead you (various reasons)
- The maintainers know both the technical and political history

Chat with the Maintainers

Questions to ask:

- Easiest/hardest bug to fix in recent months?
- How are change requests made and evaluated?
- How did the development/maintenance team evolve during the project?
- How good is the code? The documentation?
- Why was the reengineering project started? What do you hope to gain?

The major problems of our work are no so much technological as sociological.

Read all the Code in One Hour

I took a course in speed reading and read "War and Peace" in twenty minutes. It's about Russia.

—Woody Allen

Problem: How can you get a first impression of the quality of the source code?

Solution: Scan all the code in single, short session.

- Use a checklist (code review guidelines, coding styles etc.)
- Look for functional tests and unit tests
- Look for abstract classes and root classes that define domain abstractions
- Beware of comments
- Log all your questions!

Reverse Engineering.11

Interview during Demo

Problem: What are the typical usage scenarios?

Solution: Ask the user!

- ... however
 - + Which user ?
 - + Users complain
 - + What should you ask ?

- Solution: interview during demo
 - select several users
 - demo puts a user in a positive mindset
 - demo steers the interview

First Project Plan

Use standard templates, including:

- project scope
 - + see "Setting Direction"
- opportunities
 - + e.g., skilled maintainers, readable source-code, documentation
- risks
 - + e.g., absent test-suites, missing libraries, ...
 - + record likelihood (unlikely, possible, likely) & impact (high, moderate, low) for causing problems
- go/no-go decision
- activities
 - + fish-eye view

Reverse Engineering.13

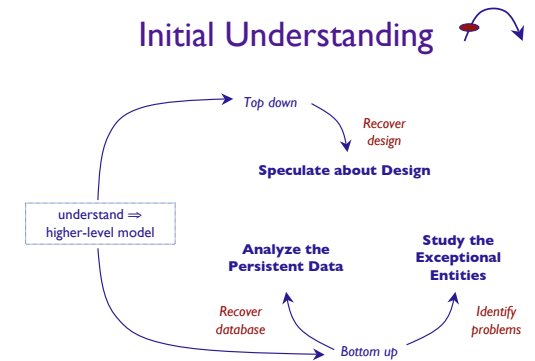

Forces — Initial Understanding

- Data is deceptive
 - + Always double-check your sources
- Understanding entails iteration
 - + Plan iteration and feedback loops
- Knowledge must be shared
 - + "Put the map on the wall"
- Teams need to communicate
 - + "Use their language"

Analyze the Persistent Data

Problem: Which objects represent valuable data?

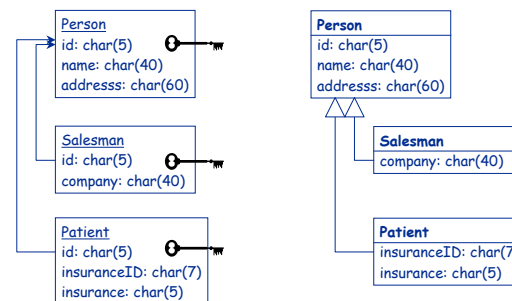

Solution: Analyze the database schema

- Prepare Model
 - + tables => classes; columns => attributes
 - + candidate keys (naming conventions + unique indices)
 - + foreign keys (column types + naming conventions + view declarations + join clauses)
- Incorporate Inheritance
 - + one to one; rolled down; rolled up
- Incorporate Associations
 - + association classes (e.g. many-to-many associations)
 - + qualified associations
- Verification
 - + Data samples + SQL statements

Reverse Engineering,20

Speculate about Design

Problem: *How do you recover design from code?*

Solution: *Develop hypotheses and check them*

- Develop a plausible class diagram and iteratively check and refine your design against the actual code.

Variants:

- Speculate about Business Objects
- Speculate about Design Patterns
- Speculate about Architecture

© S. Demeyer, S. Ducasse, O. Nierstrasz

Reverse Engineering,21

Study the Exceptional Entities

Problem: *How can you quickly identify design problems?*

Solution: *Measure software entities and study the anomalous ones*

- Use simple metrics
- Visualize metrics to get an overview
- Browse the code to get insight into the anomalies

© S. Demeyer, S. Ducasse, O. Nierstrasz

Reverse Engineering,22

Visualizing Metrics

Use *simple* metrics and layout algorithms.

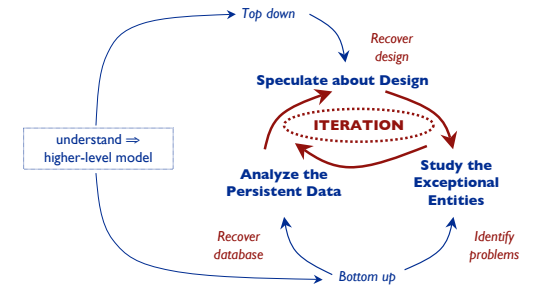

Visualize up to 5 metrics per node

Reverse Engineering,24

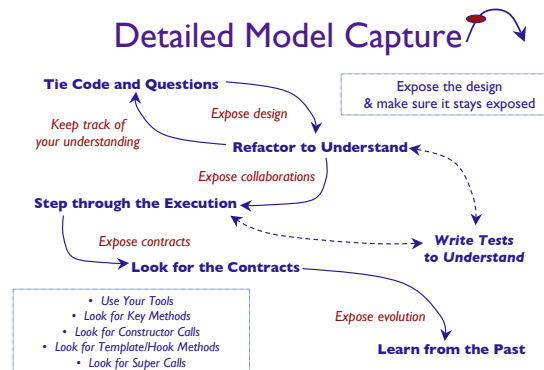

Forces — Detailed Model Capture

- Details matter
 - + *Pay attention to the details!*
- Design remains implicit
 - + *Record design rationale when you discover it!*
- Design evolves
 - + *Important issues are reflected in changes to the code!*
- Code only exposes static structure
 - + *Study dynamic behaviour to extract detailed design*

Detailed Model Capture

Reverse Engineering,26

Tie Code and Questions

Problem: *How do you keep track of your understanding?*

Solution: *Annotate the code*

- List questions, hypotheses, tasks and observations.
- Identify yourself!
- Use conventions to locate/extract annotations.
- Annotate as *comments*, or as *methods*

© S. Demeyer, S. Ducasse, O. Nierstrasz

Reverse Engineering,27

Refactor to Understand

Problem: *How do you decipher cryptic code?*

Solution: *Refactor it till it makes sense*

- Goal (for now) is to *understand*, not to reengineer
- Work with a *copy* of the code
- Refactoring requires an adequate test base
 - + If this is missing, *Write Tests to Understand*
- Hints:
 - + Rename attributes to convey roles
 - + Rename methods and classes to reveal intent
 - + Remove duplicated code
 - + Replace condition branches by methods

© S. Demeyer, S. Ducasse, O. Nierstrasz

Reverse Engineering,28

Step Through the Execution

Problem: *How do you uncover the run-time architecture?*

Solution: *Execute scenarios of known use cases and step through the code with a debugger*

- Difficulties
 - + OO source code exposes a *class hierarchy*, not the run-time *object collaborations*
 - + Collaborations are spread throughout the code
 - + Polymorphism may hide which classes are instantiated
- Focussed use of a debugger can expose collaborations

© S. Demeyer, S. Ducasse, O. Nierstrasz

Reverse Engineering,29

Look for the Contracts

Problem: *Which contracts does a class support?*

Solution: *Look for common programming idioms*

- Look for “*key methods*”
 - + Intention-revealing names
 - + Key parameter types
 - + Recurring parameter types represent temporary associations
- Look for *constructor* calls
- Look for *Template/Hook* methods
- Look for *super* calls
- *Use your tools!*

Constructor Calls: Stored Result

```
public class Employee {
    private String _name = "";
    private String _address = "";
    public File[] files = {};
    ...
}

public class File {
    private String _description = "";
    private String _fileID = "";
    ...
}
```

```
public void createFile (int position,
    String description, String identification) {
    files [position] = new File (description, identification);
}
```

Reverse Engineering,31

Constructor Calls: "self" Argument

```
public class Person {
    private String _name = "";
    ...
}

public class Marriage {
    private Person _husband, _wife;
    public Marriage (Person husband,
        Person wife) {
        _husband = husband;
        _wife = wife;
    }
    ...
}
```

```
Person::public Marriage marryWife (Person wife) {
    return new Marriage (this, wife);
}
```

Reverse Engineering,32

Hook Methods

```
public class PhoneDatabase {
    ...
    protected Table fetchTable
        (String tableSpec) {
        //tableSpec is a filename; parse it as
        //a tab-separated table representation
        ...};
}

public class ProjectDatabase
    extends PhoneDataBase {
    ...
    protected Table fetchTable (String tableSpec) {
        //tableSpec is a name of an SQLTable;
        //return the result of SELECT * as a table
        ...};
}
```

Reverse Engineering,33

Template / Hook Methods

```
public class PhoneDatabase {
    ...
    public void generateHTML
        (String tableSpec,
        HTMLRenderer aRenderer,
        Stream outputStream) {
        Table table = this.fetchTable (tableSpec);
        aRenderer.render (table, outputStream);
    }
    ...};
```

```
public class HTMLRenderer {
    ...
    public void render (Table table, Stream outputStream) {
        //write the contents of table on the given outputStream
        //using appropriate HTML tags
    }
    ...}
```

Learn from the Past

Problem: *How did the system get the way it is?*

Solution: *Compare versions to discover where code was removed*

- *Removed* functionality is a sign of design evolution
- Use or develop appropriate *tools*
- Look for signs of:
 - + *Unstable design* — repeated growth and refactoring
 - + *Mature design* — growth, refactoring and stability
