

Glamour packages - User study

Presentation

The goal of this study is to assess packages forming an application. You will assess packages through their classes and class references, analyzing what they use and how they are used, both internally and externally to the application.

This study is organized in three sections which require more and more in-depth look at packages and their classes. Each section implies that you play a different role when assessing the application, first as newcomer and potential client who wants to use the application, second as an architect who needs to assess the organization, third as a developer who performs maintenance. There are 11 questions in this study, each question relating to a task.

You will perform the study on Glamour packages. Glamour is an engine for scripting browsers for any kind of models. If you are unfamiliar with Glamour, do not hesitate to test it before the study to get a basic understanding of Glamour capabilities. Information on usage and samples are available on: <http://www.moosetechnology.org/tools/glamour>

Tool used: Package blueprint browser

Instructions

- Use only the tool indicated for the study. Do not use another browser/tool.
- Browse the documentation before performing the study:
 - **PackageBlueprintsPrinciples.pdf** explains the basics of package blueprints
 - **packageblueprints.mov** shows interactions with the package blueprint browser
 - a draft version of the journal paper describing package blueprints is provided
- Process questions in the given order (do not read questions in advance!)
- Please provide only accurate answers like the name of a class or a package, the association between two classes, the method with references.
- **Time yourself** for each question.
- Do not spend more than **20 minutes** on a question. If you reach this limit, write it down, stop the task, and proceed to the next question.
- You also have a time limit of **1h30** to answer the 11 questions so take care of your time.

A. Application assessment

As a potential client, you are assessing the package dependencies of the application. You want an idea about the size of the application and the kind of dependencies needed, especially if it involves new dependencies to be loaded with the application.

1) How big is the application?

Time taken: 2min

(a) In number of packages

10

(b) In number of classes (one of the following ranges):

[] <100; [x] 100-200; [] 200-300; [] > 300

2) What are the most important packages?

Time taken: 2min

- (a) In terms of outgoing dependencies
Glamour-Tests
- (b) In terms of incoming dependencies
Glamour-Core
- (c) Overall, considering both outgoing and incoming dependencies
Glamour-Core

3) Focus on package Glamour-Morphic:

Time taken: 7min

- (a) list all package dependencies which are external to Glamour.
Morphic, Polymorph-Widgets, Mondrian, Morphic-MorphTreeWidget, Balloon, Shout, Magritte-Morph, Graphics, Collection-String, Collection-Sequenceable, DeprecatedPreferences, Collection-Arrayed, FreeType, Polymorph-Tool-Diff, Collection-Unordered
- (b) in this list, please signal any external package which is not part of Pharo base (i.e., package must be loaded with Glamour).
Mondrian, Morphic-MorphTreeWidget, Magritte-Morph
- (c) are there other unexpected/unwanted package dependencies?
yes, the one with DeprecatedPreferences.

B. Application architecture assessment

As an architect, you now want to check the organization of your packages. You want your packages to have a good rationale for existence in the application. You want some parts of the application to be modular.

4) Please characterize **each** Glamour package as either:

Time taken: 5min

- a provider package for external clients (package with which external clients interact)
Glamour-Browser, Glamour-Tools, Glamour-Presentations, Glamour-Core
- an internal package (package which should not be accessed by external clients)
Glamour-Helpers, Glamour-Tests, Glamour-Announcements, Glamour-Test-Morphic, Glamour-Examples, Glamour-Morphic,

5) Are some Glamour packages optional/modular (package can be unloaded without impacting application core)?

Time taken: 1min30

Yes: Glamour-Test-Morphic, Glamour-Examples

6) What are the important classes (consider incoming, outgoing, inheritance dependencies) in Glamour-Core? If possible, explain their roles.

Time taken: 6min

- GLMBrowser: is the macro-entity of the browser, it includes panes
- GLMPresentation: it represents the display of a Pane
- GLMTransmission: it is the class representing communications between panes
- GLMPane: it is the entities in a browser.

7) Are there direct cyclic dependencies from Glamour-Core to another package?

Time taken: 1min30

No

C. Detailed assessment

As a developer, you want a detailed comprehension and assessment of dependencies between classes and packages and optionally to refactor such dependencies, assessing impact of change.

First give a precise answer then provide your explanation.

8) What are the most cohesive packages of the application?

Time taken: 3min

It seems to be Glamour-Core.

A lot of links between classes exists.

9) There is a dependency to DeprecatedPreferences in Glamour-Morphic. Can you detect the faulty class? Explain the dependency: do you see an easy way to solve it?

Time taken: 4min

The faulty class is GLMMorphicRenderer. The class Preferences is used to define the font of a presentation. It seems to be easy to replace this dependency by a static reference to a font, or by a reference to the new Preferences of Pharo.

10) Can you explain the organization of Glamour-Morphic and its relationship with other packages?

Time taken: 4min

Glamour-Morphic is a collection of classes which represents the user interface. It uses a lot of other "interaction" packages (Morphic, Announcements...). The internal structure is not so cohesive: it is a collection of classes, but is used by one class (GLMMorphicRenderer), which is used to build the user interface.

11) Multiple packages of Glamour have dependencies to external library Mondrian. List such packages. Could you extract this dependency and make it optional (you can propose a solution)?

Time taken: 5min30

Glamour-Tests, Glamour-Morphic, Glamour-Tests-Morphic, Glamour-Examples, Glamour-Presentations

The dependencies are for embedded Mondrian in Glamour. Some dependencies could be changed easily (Glamour-Tests, Glamour-Tests-Morphic, Glamour-Examples) by creating new packages (Glamour-Tests-Mondrian, Glamour-Example-Mondrian).

For the packages Glamour-Presentations and Glamour-Morphic. I propose to extend concerned methods in a new package (Glamour-Mondrian).

D. Personal remarks

You can provide any additional remarks about the study itself, the tasks, the tool used.

E. Personal evaluation of Package blueprints

1	2	3	4	5
Strongly disagree	Disagree	Neither agree nor disagree	Agree	Strongly agree

Question	1	2	3	4	5
Does package blueprint help you to understand dependencies between packages?					x
Would you use package blueprint when you need to understand packages?				x	
Did the outgoing view help you?					x
Did the incoming view help you?			x		
Did the inheritance view help you?	x				
Was package blueprint useful to get an impression of the most used classes in a package?				x	
Was package blueprint useful to get an impression of the most referencing classes in a package?				x	
Was package blueprint useful to get an impression of package cohesion?			x
