

Understanding Messages: Sequence and Cascade

Expression Sequence

. is a separator

```
expression1.  
expression2.  
expression3
```

Example

```
Transcript cr.  
Transcript show: 1.  
Transcript show: 2
```

Expression Sequence

- . is a separator, not a terminator
- no need to put one at the end
- no point after temporary variable declaration

```
| macNode pcNode |  
macNode := Workstation withName: #mac.  
macNode sendPacket: 'Hello World'
```

Cascade: Sending Multiple Messages to an Object

```
Transcript cr.  
Transcript show: 1.  
Transcript show: 2
```

is equivalent to:

```
Transcript  
  cr ;  
  show: 1 ;  
  show: 2
```

- ; is called a cascade

Cascade Example

Sending Multiple Messages to an Object

```
| c |  
c := OrderedCollection new.  
c add: 1.  
c add: 2
```

is equivalent to:

```
OrderedCollection new  
  add: 1 ;  
  add: 2
```

- `add: 2` is sent to the receiver of message `add: 1`
- this receiver is the instance of `OrderedCollection`

What You Should Know

- . is a separator
- ; (cascade) is useful to avoid repeating the receiver
- the cascade returns the last message returned value
