Advanced Object-Oriented Design

Essence of Dispatch

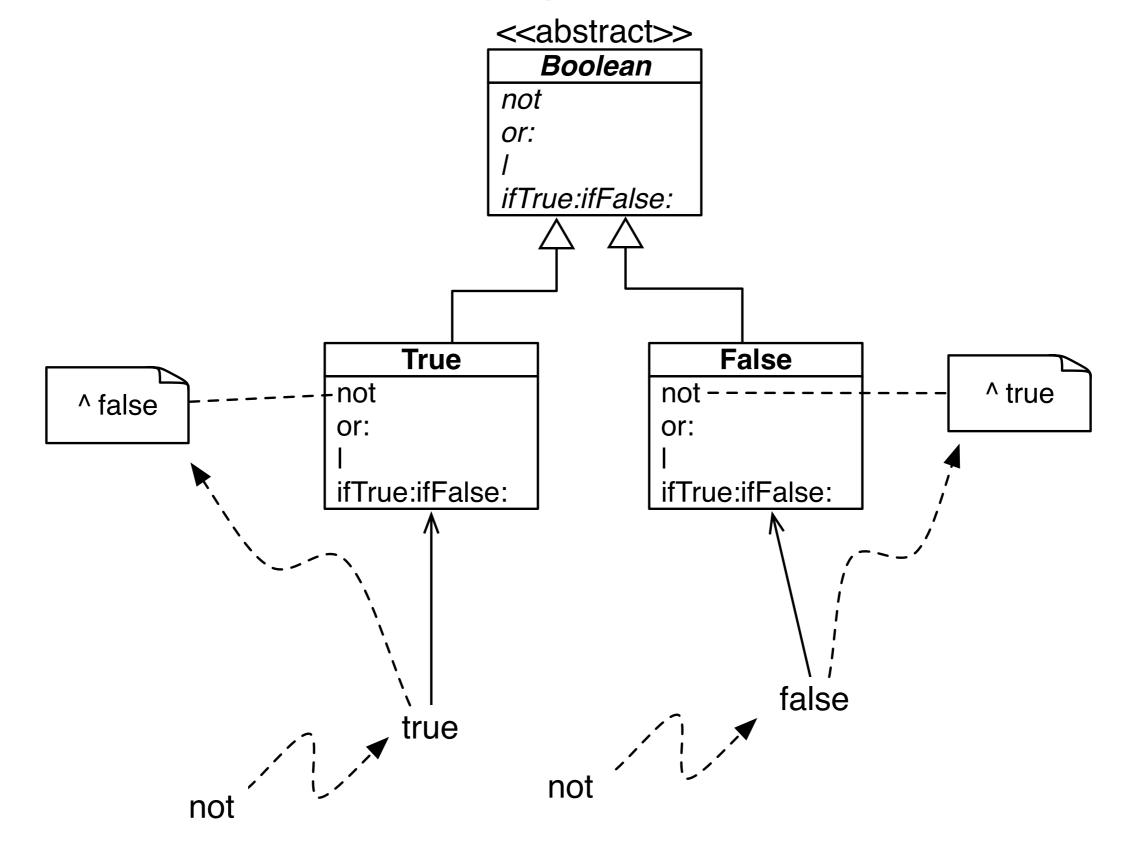

Let the receiver decide

S.Ducasse, L. Fabresse, G. Polito, and P. Tesone

Remember: Implementing not in two methods

What is the point?

- You will probably never implement Booleans in the future
- So, is it really useful?
- What are the lessons to learn?
- What are the properties of the solution?

Imagine having more than two classes

MicAbstractBlock MicAbstractAnnotatedBlock MicAnnotatedBlock MicContinuousMarkedBlock MicCommentBlock MicQuoteBlock MicTableBlock MicListBlock MicOrderedListBlock MicUnorderedListBlock MicParagraphBlock MacParagraphBlock MacRawParagraphBlock MicRootBlock MicSectionBlock

MicSingleLineBlock MicAnchorBlock MicHeaderBlock MicHorizontalLineBlock MicStartStopMarkupBlock MicEnvironmentBlock MicMetaDataBlock MicSameStartStopMarkupBlock MicCodeBlock MicMathBlock MicMathBlockExtensionForTest MicMultilineComment

Imagine a method that has one condition for each of these cases!

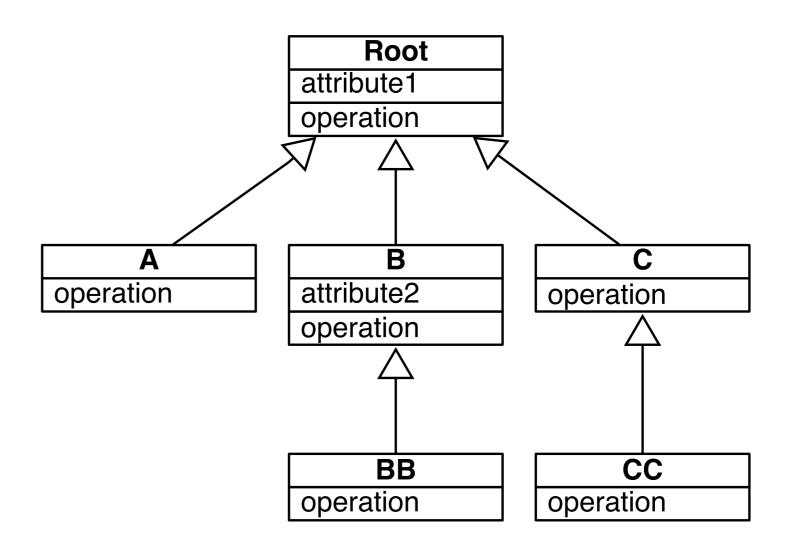

A message send is an open conditional

Sending a message

- selects the right method to execute based on the class of the receiver
- can be seen as a condition without explicit ifs
- is a dynamic choice

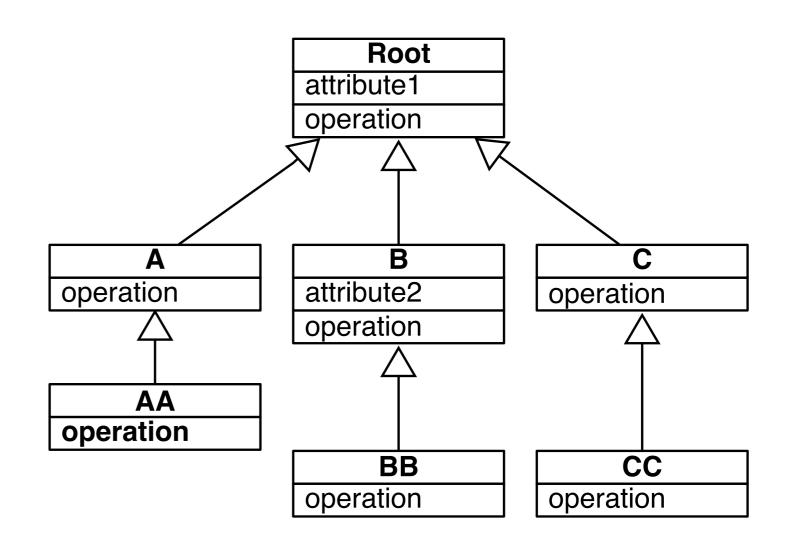

Select the right method

```
aCollection := {a . bb . c}.
...
aCollection do: [ :e |
e operation]
```

But dynamically: new objects can be chosen

aCollection := {a . bb . c . aa}.
...
aCollection do: [:e |
e operation]

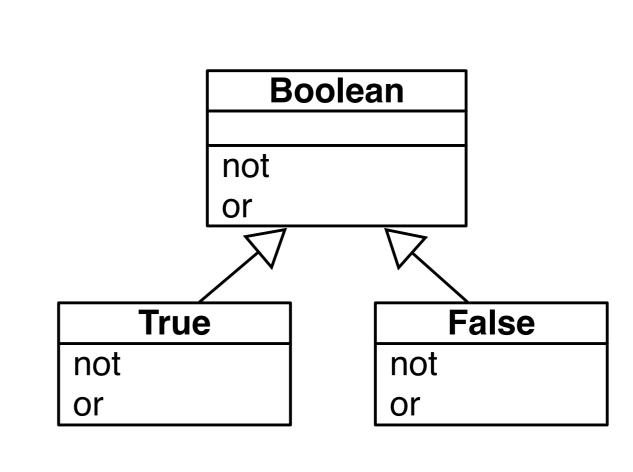

Sending a message is making a choice

- Message sending is a choice operator
- Each time you send a message, the execution engine selects the right method depending on the class of the receiver
- So, the next question is:
 - How do we express choices?

How do we express choices?

- Could we have the same solution for not with a single Boolean class?
- No! We would have conditionals in the not and or methods!

Boolean not or

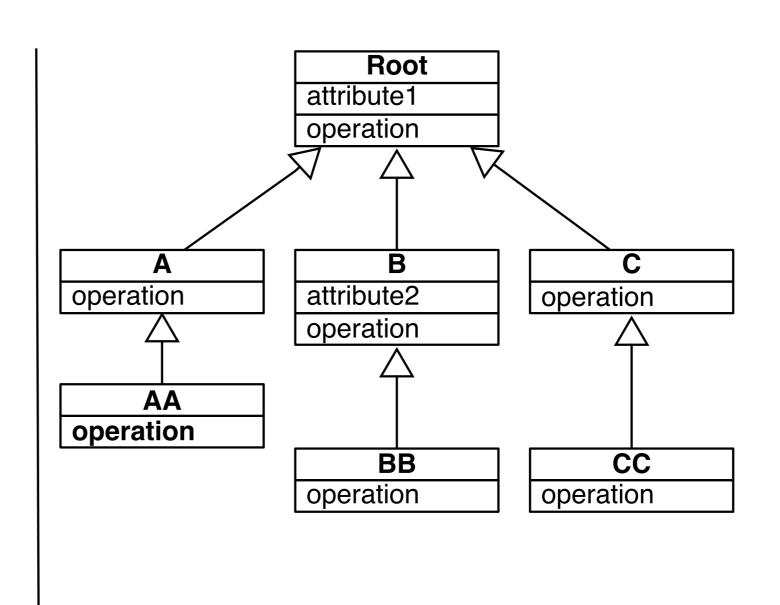

Classes play case distinct choices

- To activate the choice operator we must have choices
- A class represents a choice (a case)

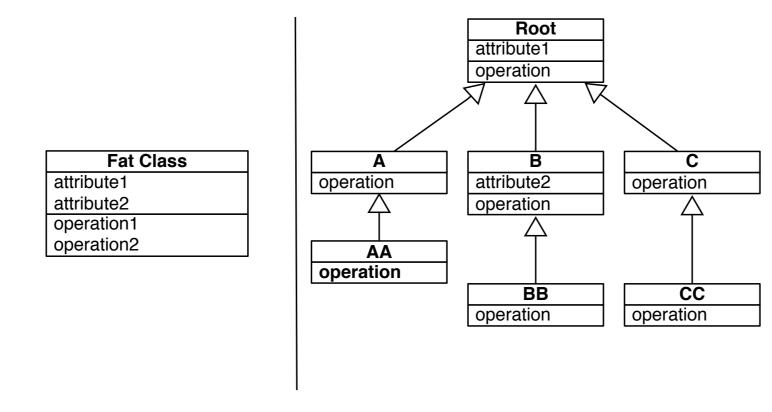

One class vs. a hierarchy

Fat Class
attribute1
attribute2
operation1
operation2

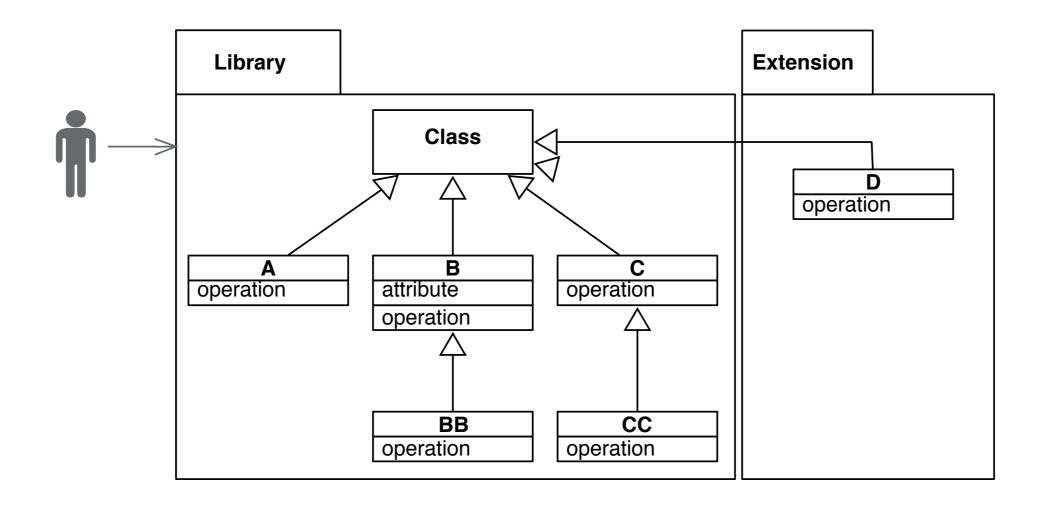

Class hierarchy supports dynamic dispatch

- More modular
- No need to introduce complex conditions
- A hierarchy provides a way to specialize behavior
- No need to recompile existing methods
- You only focus on one class at a time

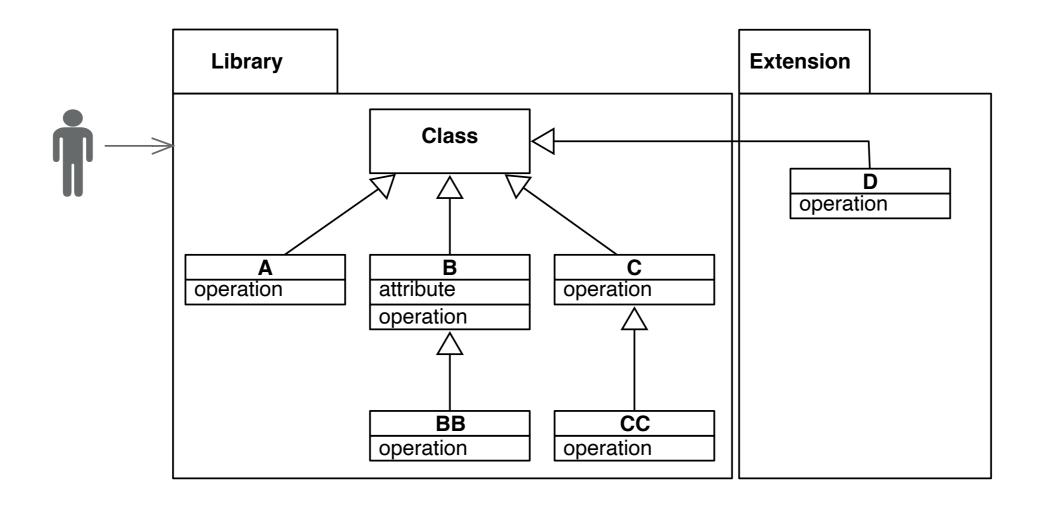

Message dispatch supports modularity

We can package different classes into different packages (better modularity)

Limit impact of changes

- If a client receives instances of D (in addition to classes of first package), its code does not have to change
- Method operation of D instances will be executed naturally

Message send is powerful

- Message sends are supporting choices
- The execution engine acts as a conditional switch: Use it!
- Classes act as "cases/choices"
- But with messages, the case statement is extensible:
 - adding new classes without breaking client code

Let the receiver decide

- Sending a message lets the receiver decide
- Client does not have to decide
- Client code is more declarative: give orders
- Different receivers may be substituted dynamically

Summary: a cornerstone of OOP

- Avoid conditionals (see AntilfCampaign)
- Use objects and messages whenever you can
- Let the receiver decide: Do not ask, tell
- Class hierarchy supports for dynamic dispatch
