**Advanced Object-Oriented Design** 

#### Why testing is Important?

S. Ducasse

http://www.pharo.org

- Why tests are important?
- What are their advantages?
- What are the techniques to write good tests?

# Why testing?

- Tests are your life insurance
- Increase trust that a change did not break something
- Reduce the **fear** of changes
- Support code understanding
- Tests do not avoid breaking your system
- But they show what you broke!

A test that is not automated does NOT EXIST!

### Automated tests are your life insurance

- Our brain is too small to remember everything
- Our brain focuses on our last action
- You write a test once and you execute it million times
- Programming is modeling the world and the world is changing

### Automated tests ensure software can evolve

- Tests make you **bold** in regards of changes
- Tests lower the fear of breaking
  - You can try and run the tests to get an idea
  - You can **explore** alternatives
  - You can understand that misunderstood something

# **Test positive properties (1)**

- Find bugs when they appear
- improve customer trust
- Reproduce complex scenarii
- Guarantee old bugs are caught if reappear
- Isolate a problem

## Some characteristics of a good test suite

- Check extreme cases (e.g., null, 0 and empty)
- Check complex cases (e.g., exceptions, network pbs)
- 1 test for each bug (at least)
- Good coverage
- Check abstractions
- Check units independently

### **Understanding code: API and result**

testConvert self assert: Color white convert equals: '#FFFFFF'. self assert: Color red convert equals: '#FF0000'. self assert: Color black convert equals: '#000000'

# fromString: and convert interplay

```
testFromStringIsCoherentWithConvert
  | table aColorString |
  table := #('0' '1' '2' '3' '4' '5' '6' '7' '8' '9' 'A' 'B' 'C' 'D' 'E' 'F').
  table do: [ :each |
     aColorString := '#', each, each, '0000'.
     self assert: ((Color fromString: aColorString) convert sameAs: aColorString)].
```

### **Understanding code**

You do not have to know how numbers are implemented to understand that this bitShift: is working.

testBitShift self assert: (2r11 bitShift: 2) equals: 2r1100. self assert: (2r1011 bitShift: -2) equals: 2r10.

## **Understanding code**

You do not have to know how numbers are implemented to understand that this bitShift: is working.

```
testShiftOneLeftThenRightGetsOne
    "Shift 1 bit left then right and test for 1"
    1 to: 100 do: [:i |
        self
        assert: ((1 bitShift: i) bitShift: i negated)
        equals: 1].
```

# Understanding code ;/

- Not always the case but this is ok too.
- · Low-level tests are worth but you should know when

```
convert

|s|

s := '#000000' copy.

s at: 2 put: (Character digitValue: ((rgb bitShift: -6 - RedShift) bitAnd: 15)).

s at: 3 put: (Character digitValue: ((rgb bitShift: -2 - RedShift) bitAnd: 15)).

s at: 4 put: (Character digitValue: ((rgb bitShift: -6 - GreenShift) bitAnd: 15)).

s at: 5 put: (Character digitValue: ((rgb bitShift: -2 - GreenShift) bitAnd: 15)).

s at: 6 put: (Character digitValue: ((rgb bitShift: -6 - BlueShift) bitAnd: 15)).

s at: 7 put: (Character digitValue: ((rgb bitShift: -2 - BlueShift) bitAnd: 15)).

^ s
```

## ""Limit"" dependency to elements not under test

Imagine that we want to test a transformation of a piece of code

- If we depend on the compiler to get the test input
- It may break when the transformation is wrong, but also each time the compiler changes something!

Better have a setup that is independent from the compiler

Manually build the test input and store it in a test set up

Think about API even in the test setup

# **Positive and negative tests**

Positive

- if I do no the normal stuff,
- It passes!
- Example: You can log with correct credentials

Negative

- If I do not behave correctly,
- It breaks!
- Example: You must not be able to load with incorrect credentials
- Example: It should raise an exception if given 0

# **Test positive properties (2)**

- Give simple and reproducible examples
- Executable snippets
- Illustrate the API
- Give up-to-date documentation
- Check conformity of new code
- Offer a first client to new code
- Force a 'customizable' design

## **Characteristics of a good test suite**

- Deterministic
- Self-explained
- Simple/Unit/Short: with few assertions (not 10th not hundred)
- Change less frequently than the rest:
  - Test the API not the implementation
  - Limit dependency to other elements
- Good code coverage

#### Conclusion

- Tests are important
- In particular in dynamically-typed languages
- Help deliver complex projects
