Learning from a Sokoban implementation

Goal

- Think about model
- Think about messages and condition

Studying a Sokoban Implementation

Sokoban is a puzzle video game genre in which the player pushes crates or boxes around in a warehouse, trying to get them to storage locations.
`https://en.wikipedia.org/wiki/Sokoban`

Studying a Sokoban Implementation

- Developed by some students of I. Franko University (Lviv)
- Thank you so much!

Looking the implemented core model

- Block
  - EmptyBlock
  - Wall
- GameModel
- GameState
- Maze
- MazeTemplate
- MoveResult
  - Move
    - Push
  - NoMove

Let us ""Speculate about Design""

- Apply **Speculate about Design** object-oriented reengineering pattern

- **Intent:** Progressively refine a design against source code by checking hypotheses about the design against the source code.

- Use your development expertise to conceive a hypothetical class diagram representing the design.

Serge Demeyer, Stéphane Ducasse, Oscar Nierstrasz

Object-Oriented Reengineering

Patterns

Take some minutes to sketch a list of classes
- ...
- ...
- ...

A possible implementation

- Wall
- Floor
- Box
- Robot
- Target
- Board

And

- Template/Level
- Moves

Let us go back
- Block
  - EmptyBlock
  - Wall
- GameModel
- GameState
- Maze
- MazeTemplate
- MoveResult
  - Move
    - Push
  - NoMove

Gut feeling analysis

- The implemented Block model looks too shallow
- Remember classes
  - are representing cases
  - are the basis for dispatch
- Not enough classes leads to tricky conditionals and monolithic systems
- Remember the lectures **Implementing not, or...**
Let us check the class API

Classes define:

- isEmptyBlock
- isWall
- hasPlayer
- hasTarget
- hasBox

Let us check the way this API is used

Too many ifs....

```
GameView >> drawBlock: aBlock on: aCanvas
  aBlock isWall
    ifTrue: [ self drawWall: aCanvas ]
    ifFalse: [ aBlock isEmptyBlock
      ifTrue: [ aBlock hasPlayer
          ifTrue: [ aBlock hasTarget
            ifTrue: [ self drawTargetAndPlayer: aCanvas ]
            ifFalse: [ self drawPlayer: aCanvas ]]
        ifFalse: [ aBlock hasBox
          ifTrue: [ aBlock hasTarget
            ifTrue: [ self drawTargetAndBox: aCanvas ]
            ifFalse: [ self drawBox: aCanvas ]]
          ifFalse: [
            aBlock hasTarget
              ifTrue: [ self drawTarget: aCanvas ]
            ifFalse: [ self drawEmptyBlock: aCanvas ]]]
```

Analysis

The model only defines EmptyBlock and Wall

- No Player, no target, no box.
- **Too much logic** is put in EmptyBlock
- Too much Ask, **not enough Tell** (**Do not Ask, Tell**)

With a better model

- Block
  - Box
  - BoxOnTarget
  - EmptyBlock
  - Player
  - Wall

- We can send **messages** to the 'correct' object
- We can tell and not ask!

A first nicer solution

```
GameView >> drawBlock: aBlock on: aCanvas
  aBlock isWall ifTrue: [ self drawWall: aCanvas ].
  aBlock isEmptyBlock ifTrue: [
  aBlock hasPlayer ifTrue: [ ...
```

Becomes

```
GameView >> drawBlock: aBlock on: aCanvas
  aBlock drawOn: aCanvas

Wall >> drawOn: aCanvas
  "Cairo code"

EmptyBlock >> drawOn: aCanvas
  "Cairo code"
```

A solution supporting multiple canvases

To be able to have the rendering supporting multiple back-ends (morphic, Cairo...) drawing should not be in the Block classes

A solution supporting multiple canvases

```
GameView >> drawBlock: aBlock on: aCanvas
  aBlock isWall ifTrue: [ self drawWall: aCanvas ].
  aBlock isEmptyBlock ifTrue: [
  aBlock hasPlayer ifTrue: [ ...
```

Becomes

```
GameView >> drawBlock: aBlock on: aCanvas
  aBlock drawOn: aCanvas

Wall >> drawOn: aCanvas
  aView drawWall: aCanvas

EmptyBlock >> drawOn: aCanvas
  aView drawEmptyBlock: aCanvas
```

Double dispatch

Each block tells the view how to draw it.

```
GameView >> drawBlock: aBlock on: aCanvas
  aBlock drawOn: aCanvas view: self

Wall >> drawOn: aCanvas view: aView
  aView drawWall: aCanvas

EmptyBlock >> drawOn: aCanvas view: aView
  aView drawEmptyBlock: aCanvas
```

- We **tell** a block to draw itself and it **tells** how to the canvas
- Sending messages is powerful
- Modular

Disguided kind testing method

```
Wall >> isWall
  ^ true

EmptyBlock >> isWall
  ^ false
```

and

```
GameView >> drawBlock: aBlock on: aCanvas
  aBlock isWall ifTrue: [ self drawWall: aCanvas ]
```

is nearly the same as

```
GameView >> drawBlock: aBlock on: aCanvas
  (aBlock isKindOf: Wall) ifTrue: [ self drawWall: aCanvas ].
```

Back to the model

What are:

- MoveResult
  - Move
    - Push
  - NoMove

- Reification of player actions
- Could be good to record and replay

Let us study the API

```
MoveResult >> isMove
  ^ false

MoveResult >> isPush
  ^ false

MoveResult >> isNoMove
...
```

- Again testing kind methods
- Testing kind methods are the same as x class = MoveResult

Checking testing method use

```
GameState >> moveBy: aDirection
  | move |
  move := maze moveBy: aDirection.
  move isMove ifTrue: [ moves := moves + 1 ].
  move isPush ifTrue: [
    pushes := pushes + 1.
    moves := moves + 1 ].
  self addMove: move
```

Do not ask, tell

```
GameState >> moveBy: aDirection
  | move |
  move := maze moveBy: aDirection.
  move updateGameState: self.
  self addMove: move

Move >> updateGameState: aGameState
  aGameState incrementMoves

Push >> updateGameState: aGameState
  super updateGameState: aGameState.
  aGameState increasePushes

NoMove >> updateGameState: aGameState
  self
```

Conclusion

- **Challenge** classes
- **Little** class hierarchies are **good**
- Better **many small classes than a big one**
- **Challenge** kind testing methods
- **Check** their use
- Messages act as **dispatcher**
