# Yet another web framework?

# The problem

- Seaside?
- Amber + REST?

### Seaside

- Aging...
- Not very well prepared for "Web 2.0"

### Amber + REST

- Request nightmare
- Leads to bad design (if not super-careful)
  - Double validation problem
  - "Layer" programming

-

### We can do better

## The problem

- How to do MVC?
- How to expose domain without adding unnecessary layers?
  - ...and still be safe
- How to keep the "seaside feeling" in a fat clientserver application?

#### How?

- Amber + Pharo
- Through a communication bridge serialising JSON

### Client side

- Proxies
- Futures (kinda)
  - Keeps the flow sequential
  - It is still not synchronic, but works most of the time

### Server side

- Exposing objects
  - <action>
  - <state>
- Literals, Collections, Models

### Demo

### Counter class

```
TDCounter>>#count
  ^ count

TDCounter>>#increase
  count := count + 1

TDCounter>>#decrease
  count := count - 1
```

# Counter presenter

### Counter client

```
counterProxy := TDProxyClient on: '/counter'.
counterProxy connect.

counterProxy count. "0"
counterProxy increase
  then: [ counterProxy count ]. "1"
```

### Marina

CMS for the simple minds

### Yet another CMS?

## The problem

- Pier is HUGE
- ... and hard to learn

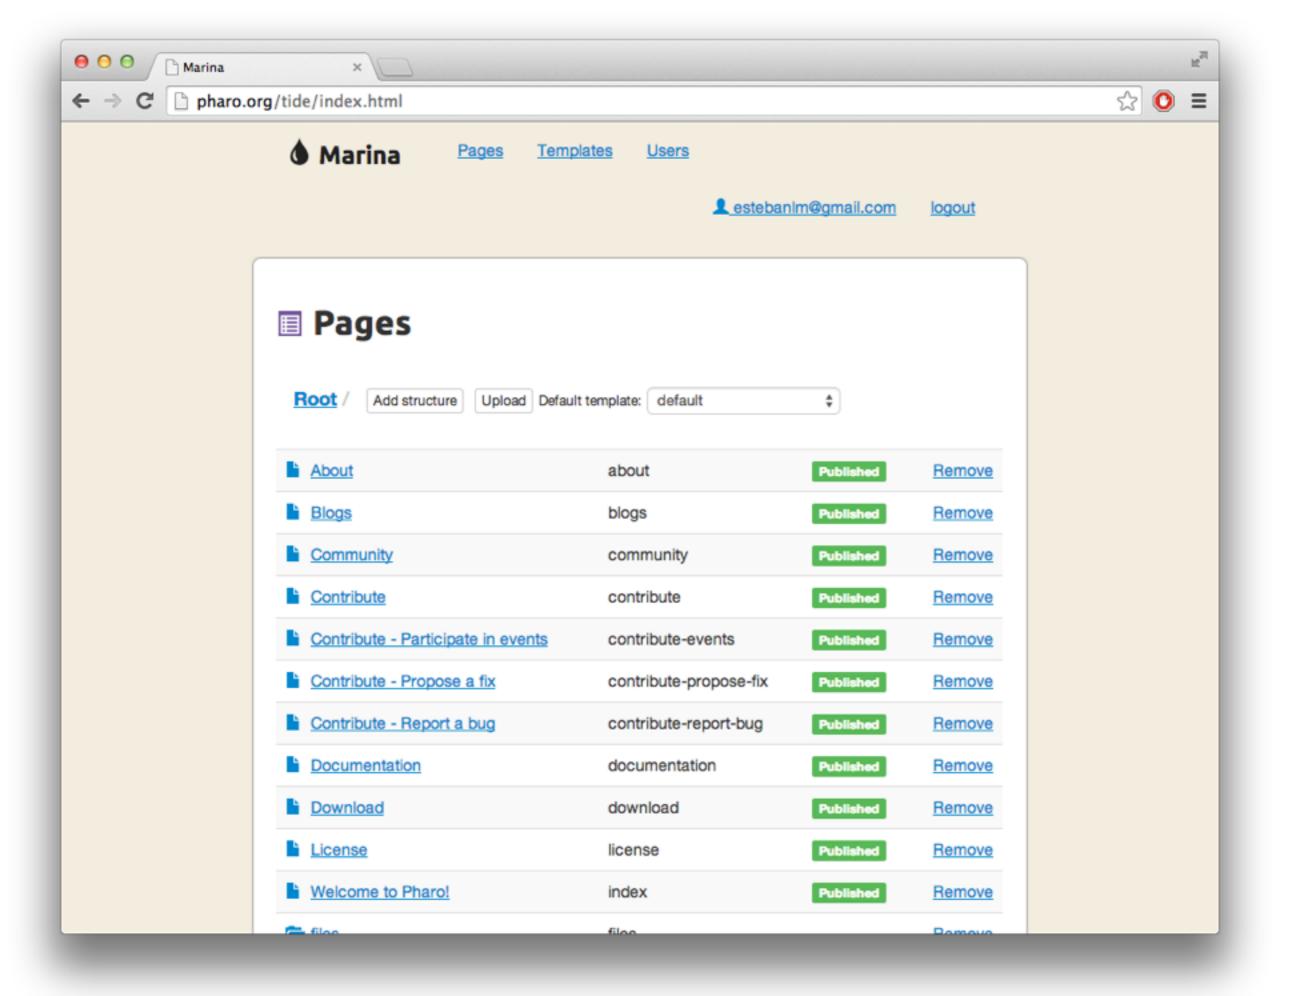

#### How?

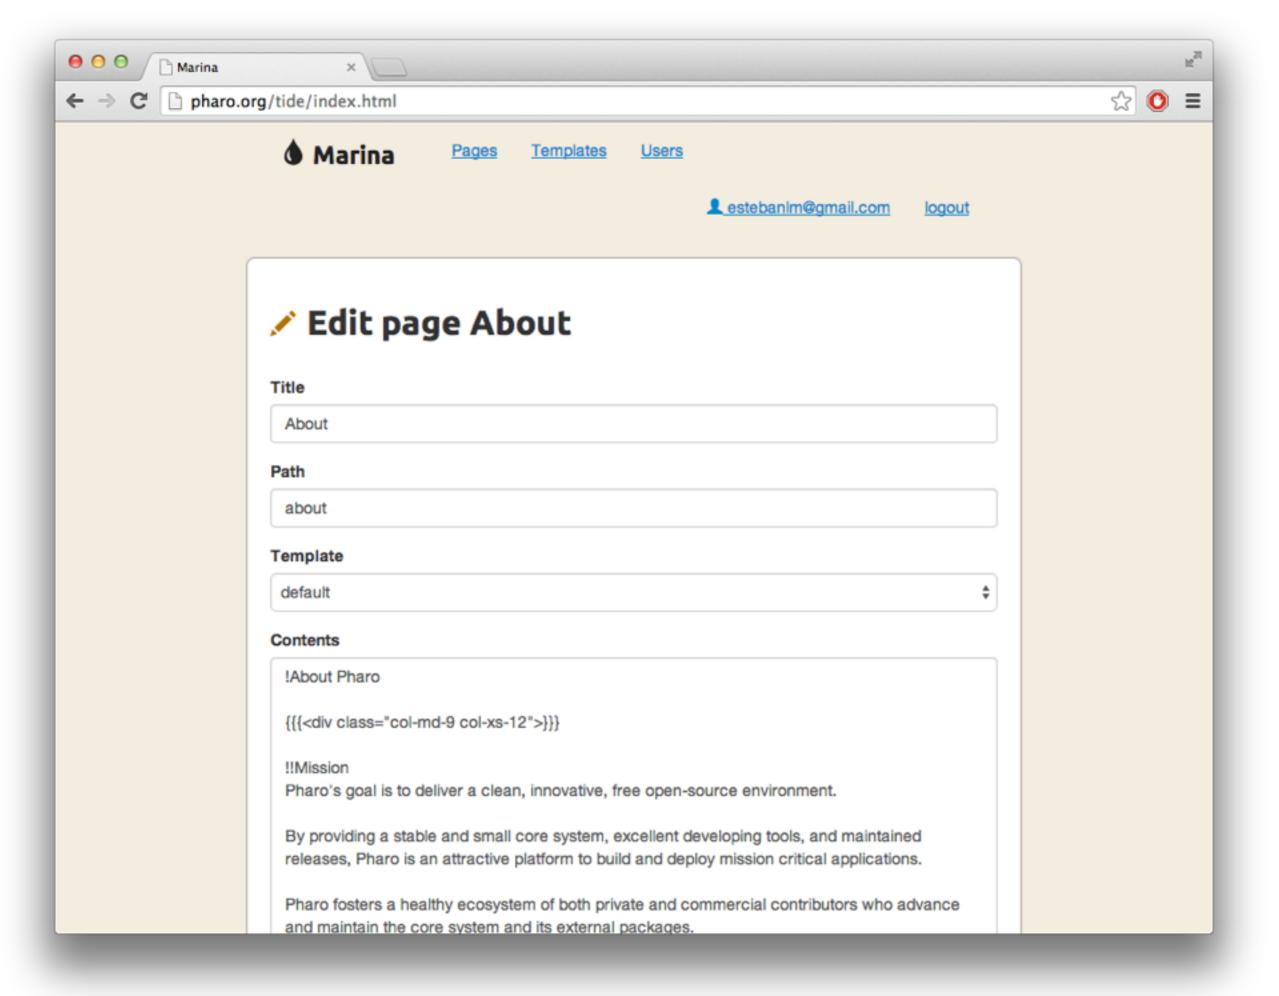

- Uses only already existing projects (we do not reinvent the wheel...)
  - On top of Tide (duh!)
  - User management: Mozilla persona
  - Syntax: Pillar (same as Pier)
  - Persistency: Voyage

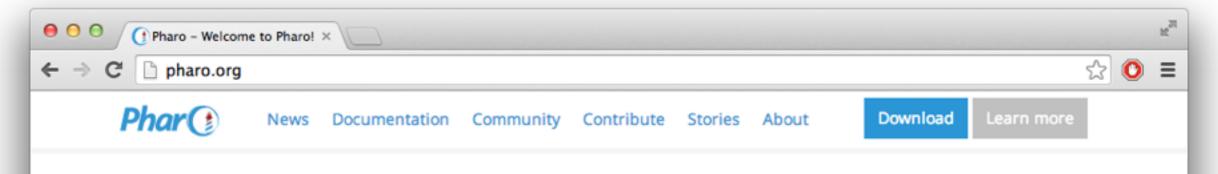

### Features

- Suitable for small/simple pages
- Very simple (yet not finished)
- Stable
- Fast
- Can accept plugins
  - For now, just a basic blog (Disqus for comments)

### Demo

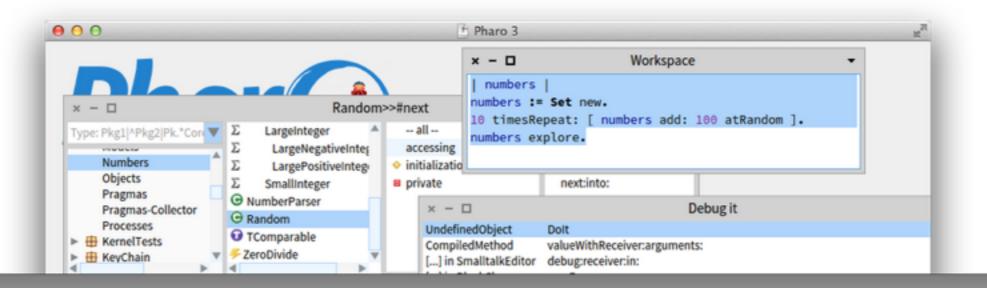

#### The immersive programming experience

Pharo gives you total control over your programming experience.

Focused on simplicity and immediate feedback, it is a pure object-oriented programming language and a powerful environment (think IDE and OS rolled into one).

It is open source and available for Mac, Windows and Linux.

### Download it today!
