

# Analysing Microsoft Access Projects: Building a Model in a Partially Observable Domain

Santiago Bragagnolo, Nicolas Anquetil,  
Stéphane Ducasse, Seriai Abderrahmane,  
Mustapha Derras

# Santiago Bragagnolo

@sbragagnolo

santiago.bragagnolo@berger-levrault.com

- 1st year PhD
- Industrial Thesis
- Software Migration

## Context: Berger-Levrault

5 Centuries old  
company

1700 employees

5 Continents

51000 clients that  
reach millions of users

# Technology evolves, information systems must evolve too: Migration Happens

# Microsoft Access Solutions @ Berger Levrault

> 90 Solutions

900 to 2700 Forms x Solution

- Standalone to Multi-layered
- Monolith to Microservice
- Desktop GUI to Web GUI

- Selective
- Interactive
- Iterative

## Implications

- Up to date Data
- Precise and Detailed Data
- Memory & CPU

# What does the literature propose as first step on migration?

### Static Analysis

- AST Extracted from text files
- Focus on a static structure of the software

## Dynamic Analysis

- Runtime crawling
- Behavior dynamics and real composition

### Hybrid Analysis

- Static analysis enhanced by dynamic
- Dynamic analysis enhanced by static

# Microsoft Access: a Partially Observable Domain

## 4GL Language

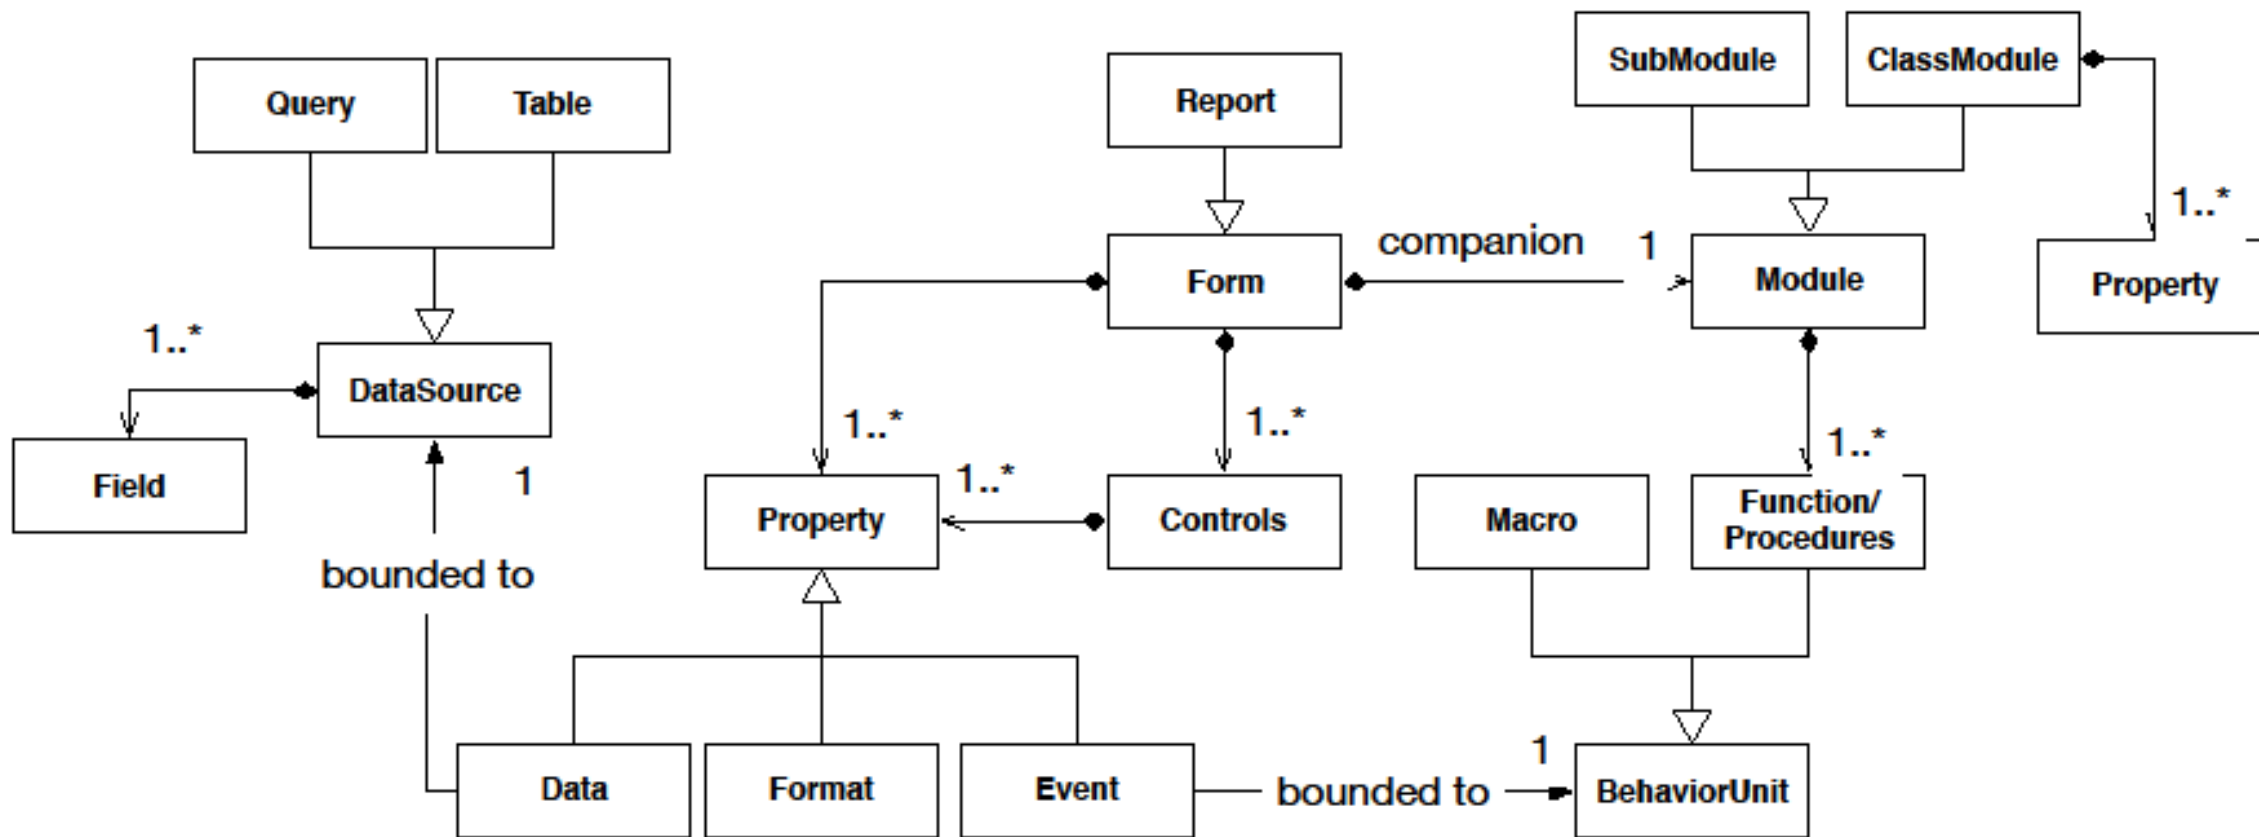

- Point and Click Development
- Generates GUI related code
- Produces Software based on intensive GUI Interaction
- Uses proprietary binary format

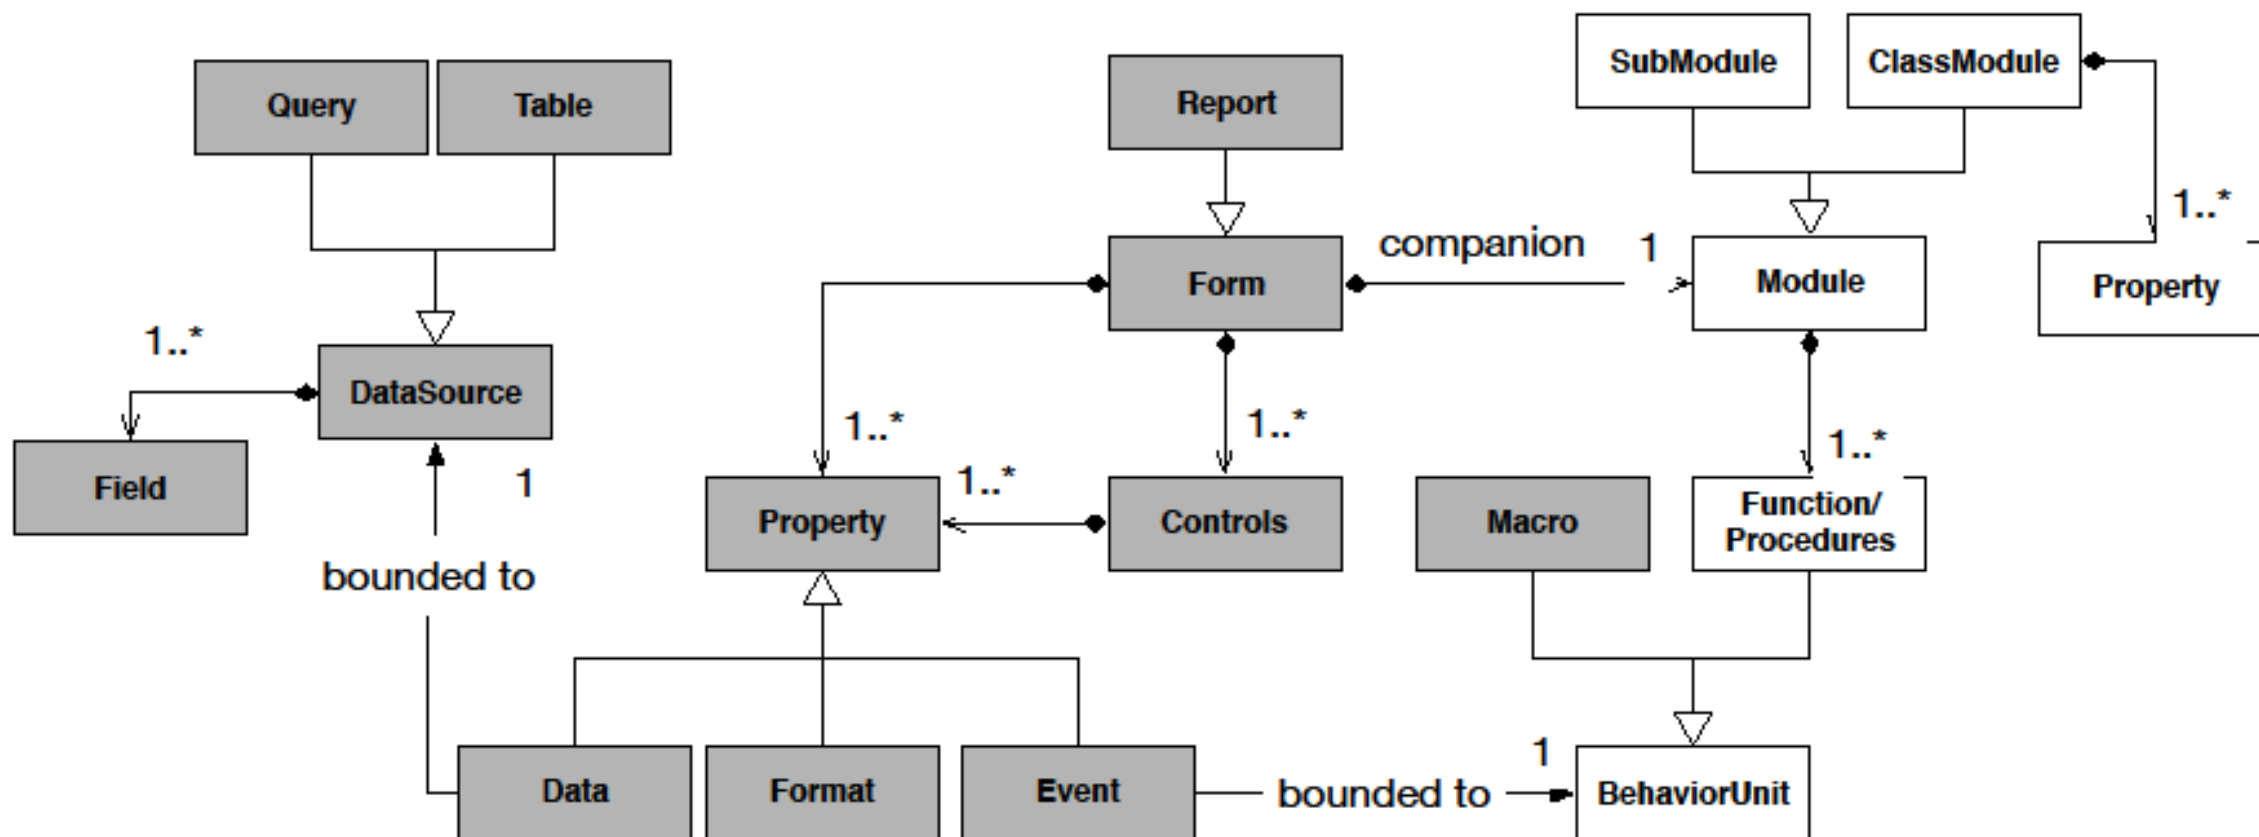

## Provides First Class Citizens

- GUI:** Form and Reports
- Functional:** Class Modules, Modules and Macros
- Data:** Tables and Queries

# Microsoft Access: An Application Overview

# Microsoft Access: GUI Exporting Limitations

## SaveAsText

- Saves a Microsoft Access first class citizen as a file
- Heterogeneous output
- Non documented

## LoadFromText

- Loads an object from a file
- Non documented

# How to practice a structural analysis on an application if all the data is inside the IDE?

RQ#1

Can we obtain an application representation by querying the IDE runtime?

RQ#2

Are we able to reengineer the meta-data sources into a model?

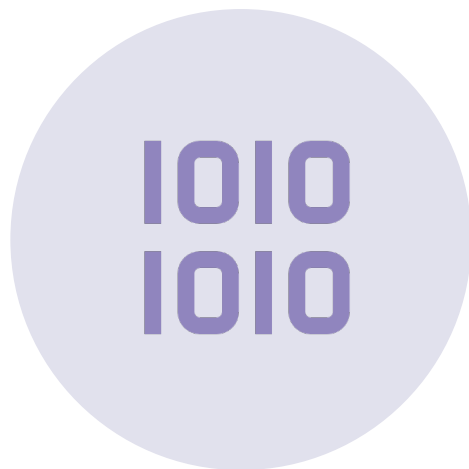

RQ#3

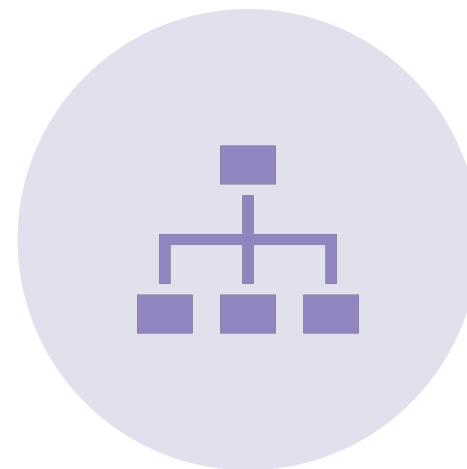

Is the obtained model suitable for migration?

**Can we obtain an application  
representation by querying the IDE  
runtime?**

# Microsoft COM Technological Overview

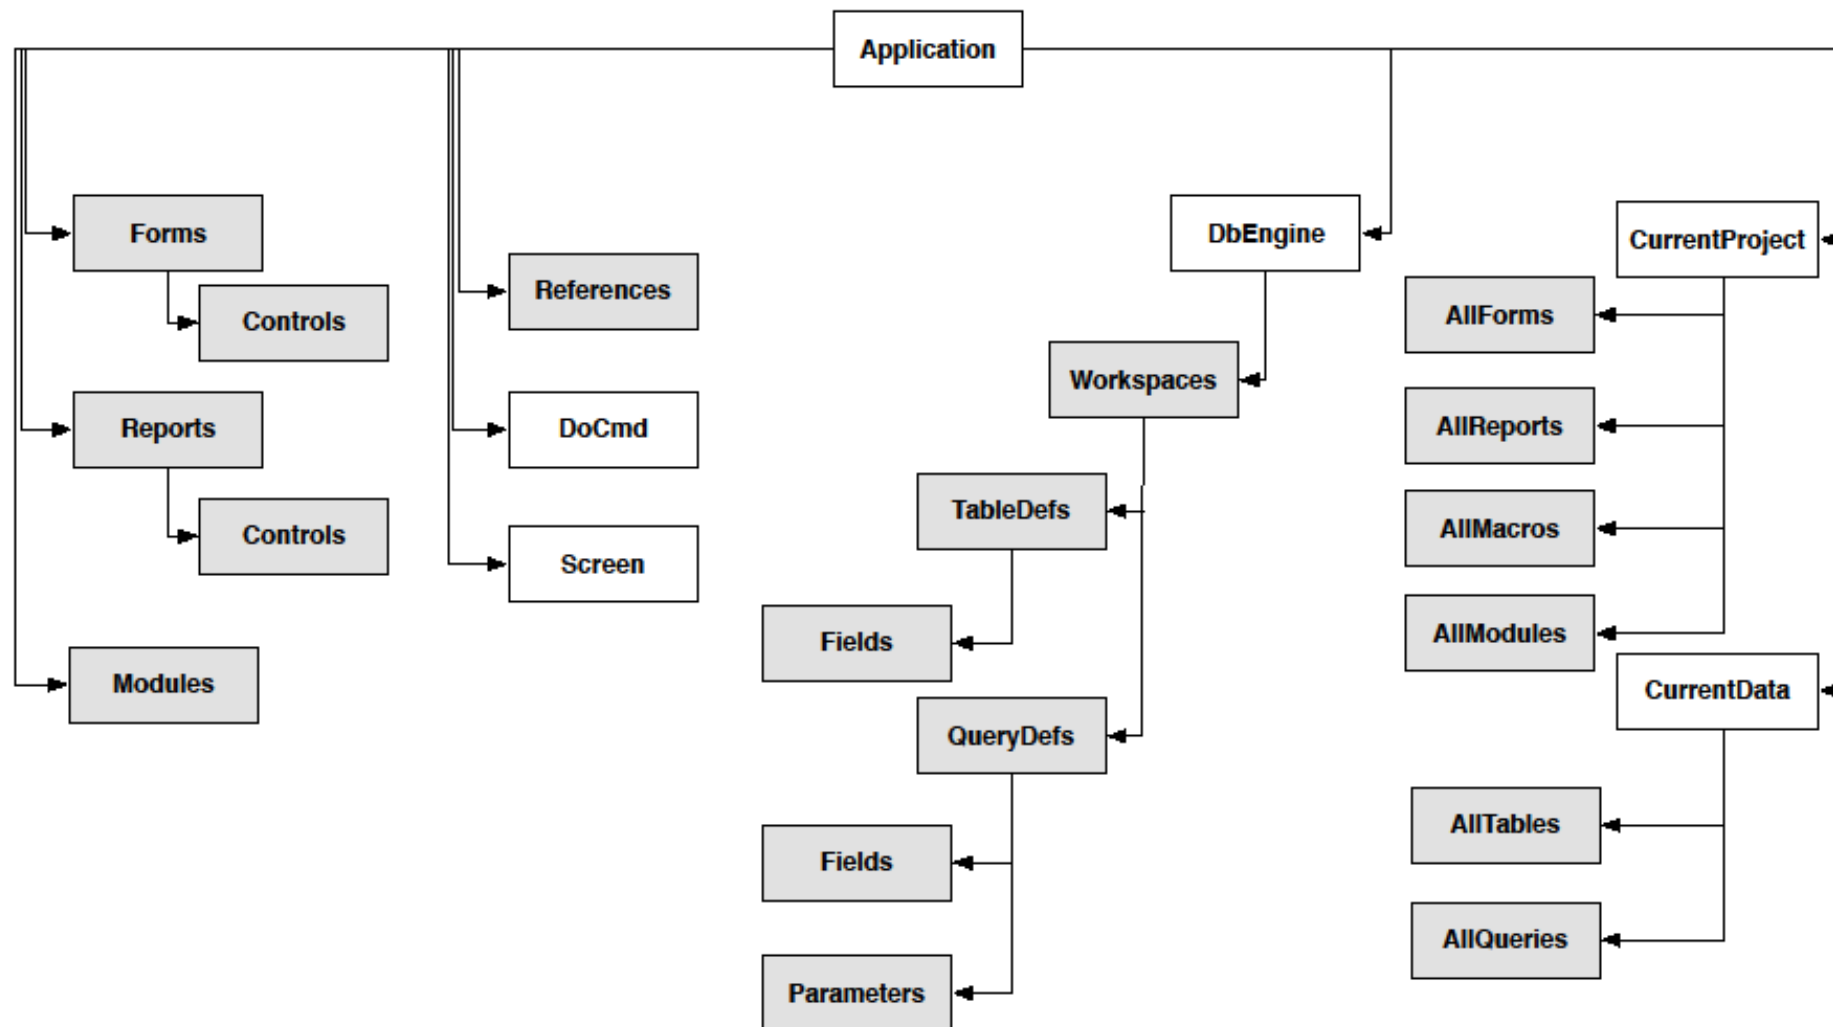

STANDARD BINARY  
INTERFACE

COMPONENT OBJECT  
MODEL

# Microsoft Access Object Model & COM

COM Handle

**Pointer to a remote object**

**Application:**  
Represents a  
running  
Microsoft  
Access  
Application

**DoCmd:** Command object. Reifies the available operations

**References:** Collection of static dependencies

**CurrentProject:** Project currently opened by the running application. Contains Forms, Reports, Modules and Macros descriptions

**CurrentData:** Database currently opened by the running application. Contains TableDef and QueryDef

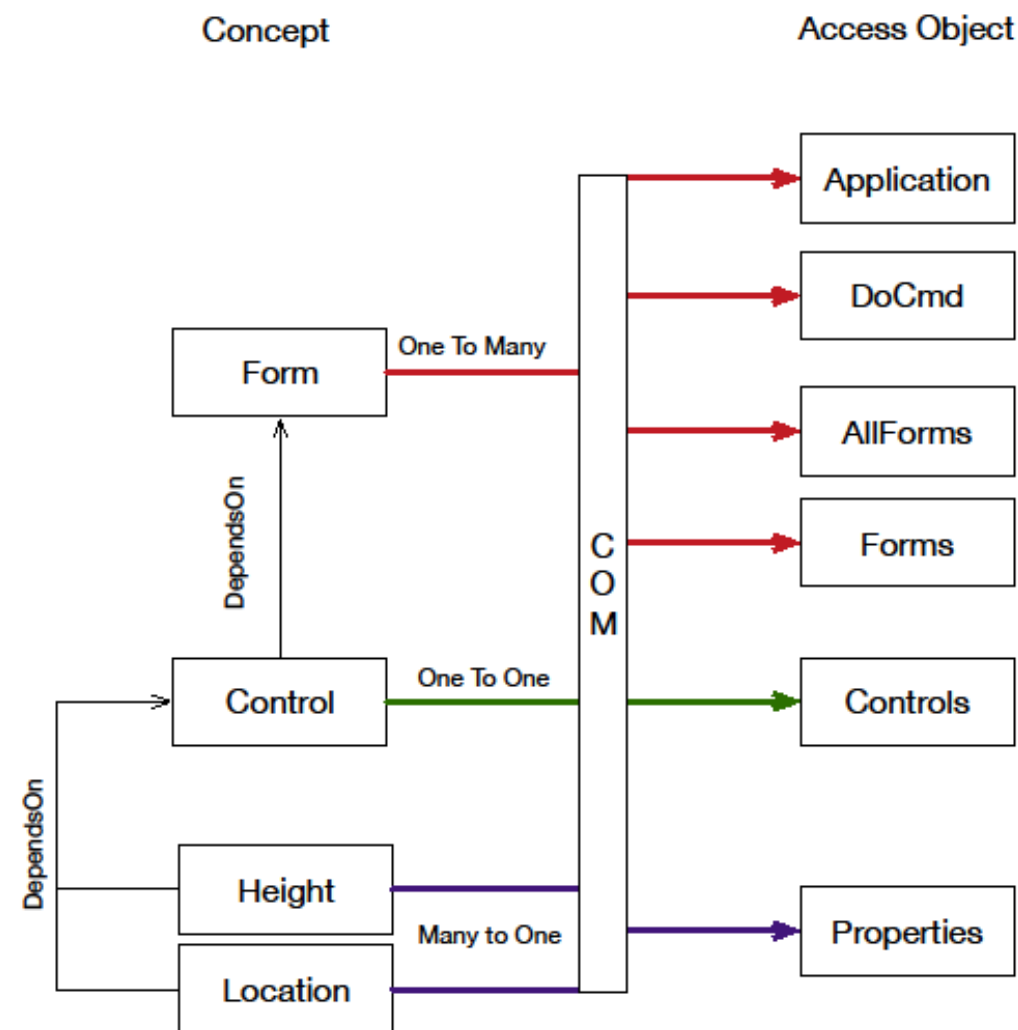

**Forms Reports and Modules:** Collections containing the opened Forms / Reports / Modules. Each object is bounded to the real “thing”

Reading a property of a COM Entity may give us another COM Entity

A model entity type may be mapped to more than one entity type

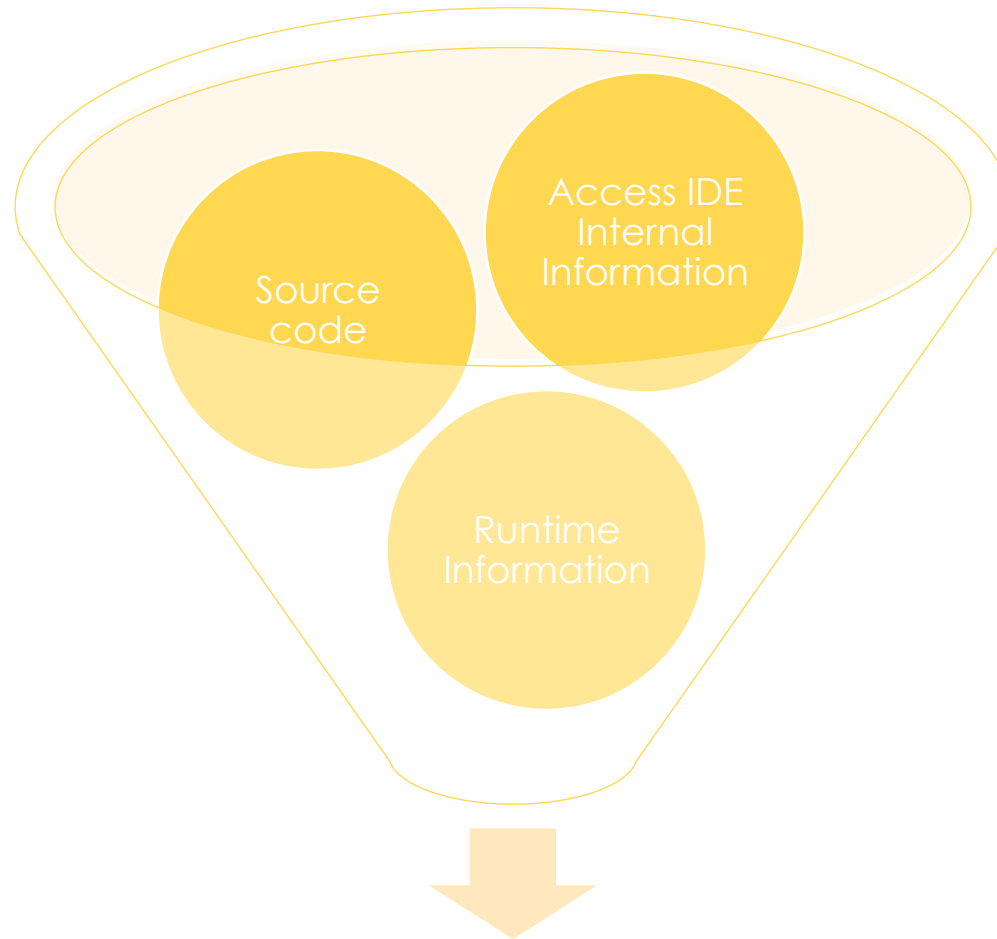

First class citizen objects must be dynamically loaded to be analyzed

Different model Entity types may be mapped to one COM entity type

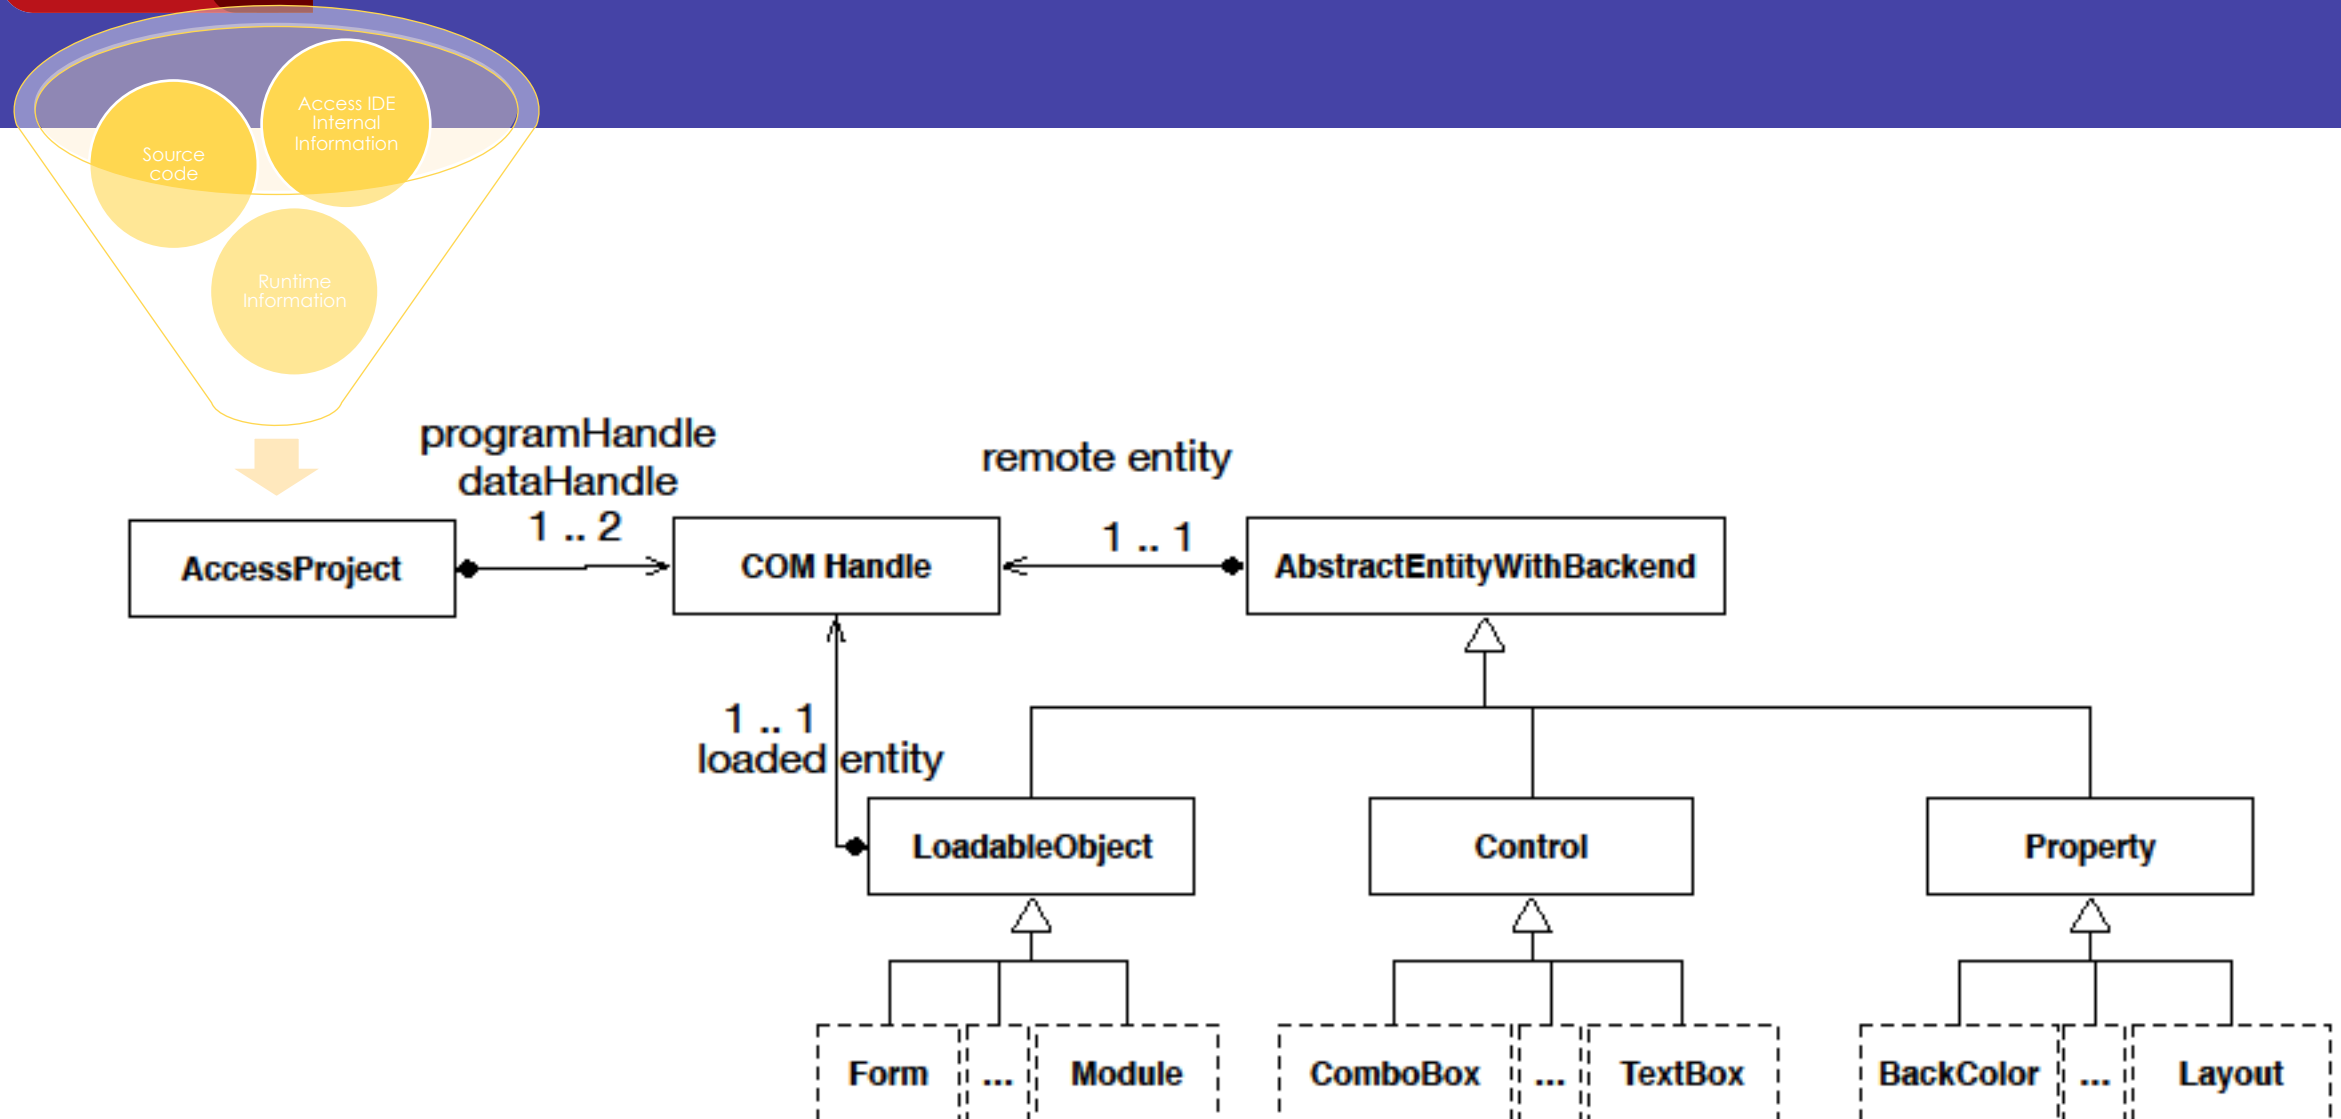

**Are we able to reengineer the meta-  
data sources into a model?**

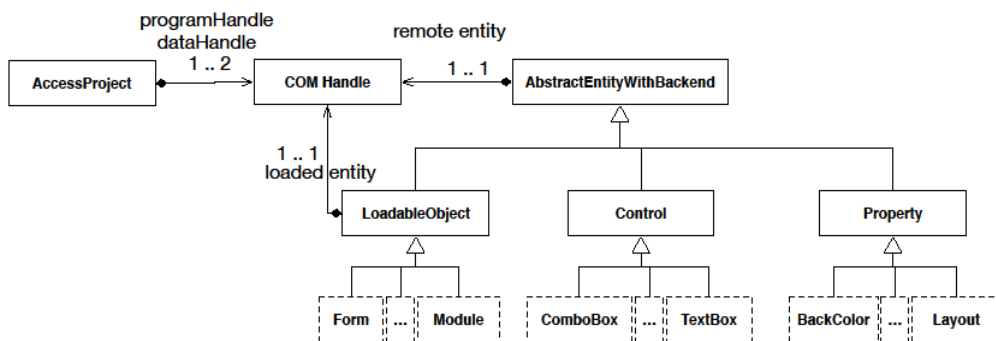

# Mixing Static and Internal MS Access information

Microsoft Access Analysis

# An Architecture Implementation for an Online Model

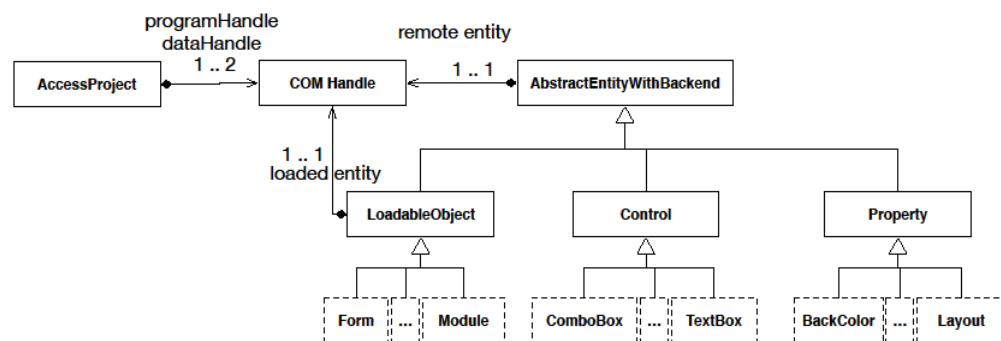

Each model type must know which readings return COM entities. A factory is used for mapping by COM type

Only Loadable objects are mapped to more than one entity. This is managed individually

Managed At the level of LoadableObject Class

When reading properties a Factory that is used for mapping types by property value

# Addressing Restrictions

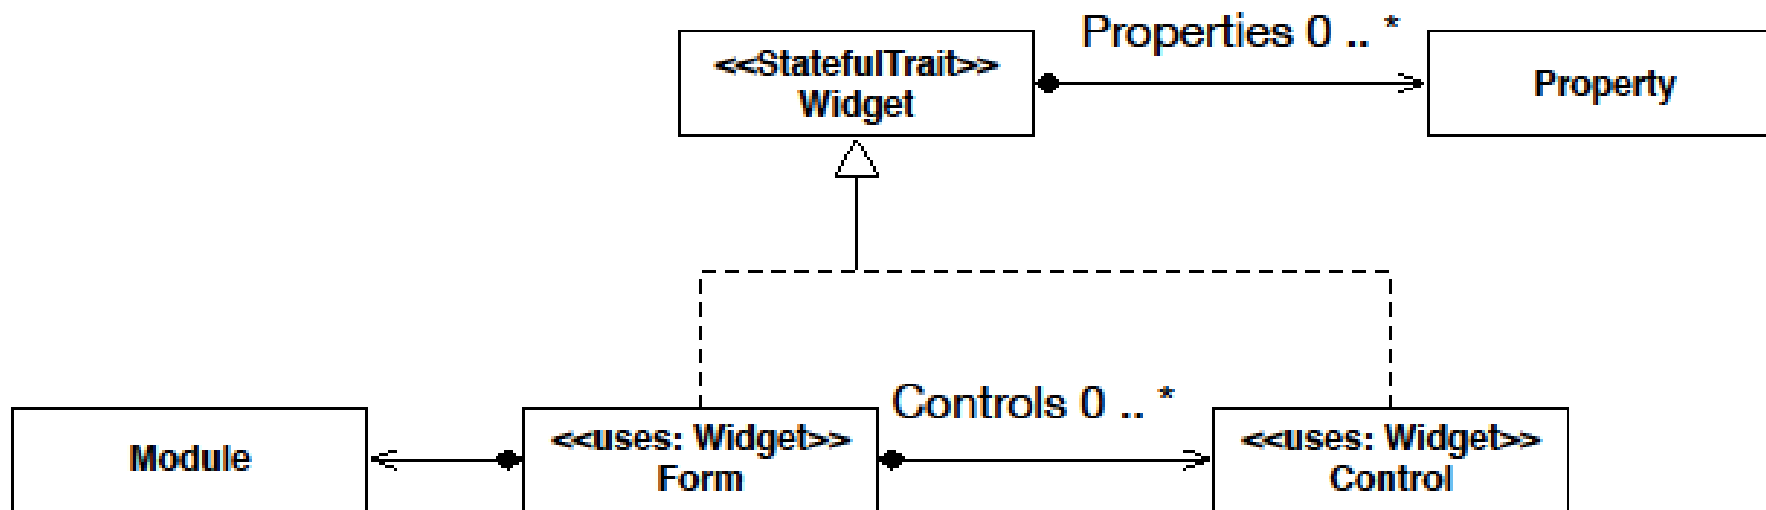

The online nature of the implementation ensures up to date data

Our solution can access what ever information reachable by COM

Lazy load + caches

# A Metamodel Implementation for an Online Model

# Is the obtained model suitable for migration?

# Is the obtained model suitable for migration? Validation Required!

What is to migrate?

To reproduce a software defined in an origin environment  
into an other environment

# Is the obtained model suitable for migration? Validation Required!

What is the simplest migration?

To reproduce the same software in the same environment:  
To Replicate

# How should a replica look like?

## Empirical Study

- 10 Projects
- 623 Components
- Many kinds of projects may not be represented

## Multiple Version

- Different versions between origin and destination may suppose a problem

## Undocumented Features Used

- Approach based on SaveAsText

## 1. Source version control-based solution

- Undocumented features

## 2. Context and performance

- Selectiveness

## 3. What our validation does not validates

- Text representation is incomplete

1 Novel approach on modeling

4 Challenges – 3 Real industry requirements

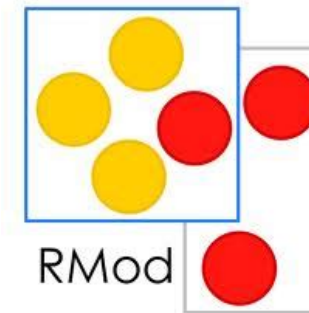

1 Implementation

1 Validation approach

Do you have some **Microsoft Access or Visual Basic 6**  
Based Migration?

Let's work together! 😊
